4

VIDEOGRAPHER: We are now on the record.

5

My name is Robert Martignetti. I'm a

6

videographer for Golkow Litigation Services.

7

Today's date is October 29th, 2020, and

8

the time is 9:01 a.m.

9

This remote video deposition is being

10

held In Re: Flint Water Cases. The deponent is

11

Joseph Graziano, Ph.D.

12

All parties to this deposition are

13

appearing remotely and have agreed to the witness

14

being sworn in remotely. Due to the nature of

15

remote reporting, please pause briefly before

16

speaking to ensure all parties are heard

17

completely.

18

Counsel will be noted on the

19

stenographic record.

20

The court reporter is Sara Clark, and

21

will now swear in the witness.

22

23

24

2

JOSEPH GRAZIANO, PH.D.

3

being by me first duly sworn, as hereinafter

4

certified, testifies and says as follows:

5

EXAMINATION

6

BY MR. TER MOLEN:

7

Q. Good morning, Dr. Graziano. How are

8

you?

9

A. Very good. Thank you, Mark.

10

Q. Good. Good. Good.

11

I represent VNA in this litigation.

12

I'll be taking the lead in asking you questions

13

today.

14

The deposition has, I believe, been set

15

for two consecutive days. My guess is I'll take

16

most of today and we'll see about my going into

17

tomorrow, and then other counsel representing

18

other parties will be asking you additional

19

questions as well, I'm sure.

20

Why don't we get going. And just at the

21

outset, Doctor, you've been deposed as an expert

22

witness before, right?

23

A. That's right.

24

Q. Okay. Anytime in the last four years?

1 A. Once.

2 Q. Okay. I'm going to presume, then, on
3 your part some familiarity with the basic rules
4 here. The key point I would suggest -- or ask you
5 to follow, Doctor, is if you don't hear a question
6 that I ask you or you don't understand it, let me
7 know and I'll repeat it or rephrase it.

8 Okay?

9 A. Fine.

10 Q. And you're doing a good job so far, but
11 in addition, to make life easier for all of us,
12 and in particular, for Sara, the court reporter,
13 if you can just wait a minute to make sure I
14 finish my question before you start answering,
15 that will be very helpful.

16 Okay?

17 A. Will do.

18 Q. All right. You understand you've been
19 retained as an expert witness in this litigation,
20 correct?

21 A. That is correct.

22 Q. Who is it who retained you?

23 A. Napoli Shkolnik.

24 Q. When did they first contact you?

1 A. So it's -- I think I have to tell a
2 little story here.

3 I was working on -- the only case in the
4 last four years where I've been deposed was a case
5 in Colorado, a law firm, Burg Simpson, a case of
6 occupational lead poisoning. And when that
7 wrapped up, I became retained by them in a second
8 case unrelated to that first, in which
9 Napoli Shkolnik was co-counsel.

10 And as a result of that, Paul Napoli
11 actually visited me in my office at Columbia and a
12 discussion of the Flint case came about. I can't
13 put the exact timeline on that, but I recall that
14 I started to work on this sometime in April of --
15 I guess it was 2019 or '20.

16 THE WITNESS: Patrick?

17 Q. Well, was it this year, sir, do you
18 recall, or last year?

19 A. Well, my interaction with Paul Napoli
20 was last year, but the involvement in this case
21 was 2020.

22 Q. Okay. Have you worked on other cases
23 with the Napoli law firm?

24 A. I'm currently involved in another case

1 that is in its early phases.

2 Q. Is this the case you mentioned in
3 Colorado?

4 A. Yes. It's an extension of that, yes.

5 Q. This is a mining case?

6 A. No, it is not.

7 Q. Is it also a lead case?

8 A. No, it is not.

9 Q. I would gather it's an arsenic case,
10 then.

11 A. No, it is not.

12 Q. What substance is involved in that case,
13 Doctor?

14 A. PFOA and PFOS.

15 Q. Interesting.

16 MR. TER MOLEN: We'll introduce what
17 we'll mark as Exhibit 1, which is a copy of the
18 one invoice we've received from the Napoli firm
19 that relates to this case, Doctor.

20 - - -

21 (Graziano Exhibit 1 marked.)

22 - - -

23 BY MR. TER MOLEN:

24 Q. And Doctor, just as an aside here, for

1 purposes of Zoom, this process, what we'll do is
2 we'll show you the document on the screen.

3 Can you see that, sir?

4 A. Yes, I can.

5 Q. Terrific. If you need it larger,
6 smaller, let us know and we'll zoom in and out as
7 appropriate.

8 And what we'll plan to do, Doctor, when
9 we first show you a document is just to quickly
10 scan through it so you can see the full document,
11 and then I'll ask you to confirm that the document
12 appears to be what I have represented it is.

13 Okay?

14 A. Okay.

15 Q. All right. So showing you what we'll
16 mark as Exhibit 1, this is a copy of an invoice
17 that you submitted in this case, right?

18 A. That is correct.

19 Q. Okay. And this is dated May 25th,
20 right?

21 A. Right.

22 Q. Have you submitted any other invoices?

23 A. No, I have not.

24 Q. And this invoice reflects --

1 MR. TER MOLEN: If you can scroll down,
2 please, Sam.

3 Q. -- the total amount of time that you
4 have spent in this case through approximately end
5 of May was 46 hours, right?

6 A. Right.

7 Q. Since May, you prepared your expert
8 report in this case, right?

9 A. Well, this was in conjunction with the
10 submission of my report.

11 Q. Okay. Have you done additional work
12 since May?

13 A. No, I have not.

14 Q. Okay. So the 46 hours represents the
15 vast majority, and perhaps all, of your work to
16 date on this case; is that right?

17 A. That's correct.

18 MR. TER MOLEN: And then, Sam, if you
19 could please scroll up.

20 Q. Here, at the outset, this is --
21 Exhibit 1 is summarizing materials that you have
22 reviewed, right?

23 A. These are materials that were --
24 1 through 6 were provided to me by

1 Patrick Lanciotti.

2 Q. Okay. And then you've omitted Number 7
3 here that says "various other documents."

4 What's included under Number 7?

5 A. What's included under Number 7 are the
6 references that I used to write my report. And
7 they are at the back of my report.

8 Q. Okay. Terrific.

9 So by "references," you mean various
10 scientific studies; is that fair?

11 A. That's correct.

12 Q. Okay. And you indicated that 1 through
13 6 were sent to you by counsel, right?

14 A. That is right.

15 Q. Okay. Had you asked counsel to send you
16 those specific documents, or those are documents
17 that counsel selected for you and sent to you?

18 MR. LANCIOTTI: Objection; privileged.

19 Dr. Graziano, if you can answer that
20 question without going into specifics about our
21 conversations, please do so.

22 A. Well, I was already quite familiar with,
23 Number 1, the publication by Hanna-Attisha, which
24 they sent to me. And I don't recall -- I think it

1 was their decision to send me the other items.

2 Q. Okay. Terrific.

3 And you've not asked to see the
4 depositions -- depositions of individuals other
5 than those that were sent -- that are identified
6 here as Number 6; is that right?

7 A. That's right.

8 MR. LANCIOTTI: Objection; form.

9 Q. Is that correct, Doctor?

10 A. That is correct.

11 Q. Okay. And why did you -- do you know
12 why you were sent those four, I think it is,
13 depositions?

14 A. I do not know why I was sent those four.

15 Q. Okay. Are the four depositions
16 identified here depositions of different
17 plaintiffs or plaintiff guardians, if you know?

18 A. As I recall, they were guardians.
19 Parents, guardians.

20 Q. Okay. Terrific.

21 And you have a written retention
22 agreement with plaintiffs for this case; is that
23 right?

24 A. I do.

1 Q. We'll show you what we've marked as
2 Exhibit 2.

3 - - -

4 (Graziano Exhibit 2 marked.)

5 - - -

6 BY MR. TER MOLEN:

7 Q. Okay. You agree, Doctor, that Exhibit 2
8 appears to be a copy of your retention agreement
9 in this case?

10 A. Yes, I do.

11 Q. Okay. And it's -- from your
12 perspective, is this a standard form retention
13 agreement that you would enter into for all of
14 your expert witness work?

15 A. I gather so. I don't do much expert
16 witness work.

17 Q. What did you do to -- let me start over.
18 What did you do to prepare for the
19 deposition today, Doctor?

20 A. I reread my report more than once; I
21 spent a couple of hours yesterday rereading a
22 couple of the references, specifically the
23 Hanna -- Mona Attisha paper. And that's about
24 all. Tried to relax, frankly.

1 MR. TER MOLEN: Okay. Let's put up a
2 copy of your report that we'll mark as Exhibit 3,
3 your report in this case.

4 - - -

5 (Graziano Exhibit 3 marked.)

6 - - -

7 MR. TER MOLEN: Great. Thanks, Sam.

8 BY MR. TER MOLEN:

9 Q. Doctor, you agree that Exhibit 3 appears
10 to be a copy of the report that you prepared for
11 this case?

12 A. Yes, I do.

13 Q. Did you have any assistance in preparing
14 this report, Doctor?

15 A. No, I did not.

16 Q. Did you provide any drafts of this
17 report to counsel?

18 A. No, not that I recall at all.

19 Q. Did you provide drafts of this report to
20 anybody else?

21 A. No, I did not.

22 Q. Are you aware that plaintiffs' counsel
23 has retained other experts for this case?

24 A. Yes. I don't know who they are, but

1 yes.

2 Q. Okay.

3 A. I'm sure I'm not the only one.

4 Q. Okay. You may have just answered this
5 question, Doctor, but to be clear, have you had
6 any communication with any other experts retained
7 by plaintiffs' counsel in this case?

8 A. No, I have not.

9 Q. Have you been provided with reports
10 prepared by experts retained by plaintiffs'
11 counsel in this case?

12 A. No, I have not.

13 Q. Other than plaintiffs' counsel in this
14 case, have you had communication with anybody else
15 regarding this case?

16 A. No, I have not.

17 Q. In addition to the cases in which you've
18 been retained, Doctor, there are additional cases
19 that the lawyers involved in the litigation refer
20 to as the class case or class cases.

21 Are you familiar with those cases?

22 A. No.

23 MR. STERN: Object to form. They are
24 proposed class actions. They have not yet been

1 certified.

2 Q. For purposes, Doctor, of preparing your
3 report, other than the depositions that were
4 identified, I think, as Item 6 in your invoice,
5 Exhibit 1, have you received any material
6 whatsoever related to the plaintiffs in this
7 litigation?

8 A. No. What I gave you on that list is
9 what I was provided.

10 Q. Okay.

11 A. I think I was also provided at one point
12 with a timeline.

13 Q. I see.

14 Who prepared that timeline?

15 A. I -- Napoli Shkolnik. I don't know --
16 that's where it came from, but...

17 Q. Okay. Is that timeline part of your
18 file in this case, Doctor?

19 A. No. I glanced at it, and I had read --
20 I had read already a couple of papers about the
21 timeline. A couple of them are referred to -- I
22 can't remember the authors' names -- in my report.
23 And it was, to me, old news by then, so I really
24 didn't pay much attention to it.

1 Q. Okay. And you're not a medical doctor,
2 correct?

3 A. Correct.

4 Q. Fair to say you have not examined any of
5 the plaintiffs in this case, Doctor?

6 A. No, I have not.

7 Q. You have not received any medical
8 records for plaintiffs in this litigation,
9 correct?

10 A. Correct.

11 Q. Let's show you what we'll mark as
12 Exhibit 4, which is a notice of the deposition of
13 you today in this case, Doctor.

14 - - -

15 (Graziano Exhibit 4 marked.)

16 - - -

17 BY MR. TER MOLEN:

18 Q. Have you seen Exhibit 4, the notice for
19 your deposition, before today, Doctor?

20 A. Yes, I have.

21 Q. Okay. And I presume that you collected
22 the materials in your file and provided them to
23 Mr. Lanciotti?

24 MR. LANCIOTTI: Objection; form.

1 A. So the materials in my file consist of
2 my report, and I provided the key references that
3 I used in writing that report, which were an ATSDR
4 profile, toxicologic profile on lead; an EPA
5 document, Integrated Science Review of Lead; and I
6 provided a copy of the retention agreement;
7 perhaps one or two other things. I don't exactly
8 recall.

9 Q. And in addition, obviously, the
10 deposition transcripts that you identified in your
11 invoice, right?

12 A. The deposition transcripts, I could not
13 access to provide them. They were provided with a
14 secure link that I went back and tried to access,
15 and it wouldn't let me in. So I couldn't revisit
16 those documents, actually.

17 Q. Okay. Understand.

18 Doctor, let's talk a bit about your
19 prior testimony in other cases. Okay?

20 A. Sure.

21 Q. You identify in your report one case in
22 which you've been deposed in the last four years,
23 right?

24 A. Right.

1 Q. That's the Buckler versus
2 Johnson Control case?

3 A. That is correct.

4 Q. What was that case about?

5 A. Mr. Buckler worked for decades for -- in
6 a battery-producing factory owned and run by
7 Johnson Controls. And he had suffered the
8 consequences of occupational lead poisoning.
9 Many, many adverse health effects. And I was
10 retained to essentially talk about relationships
11 between lead toxicity and his set of symptoms.

12 Q. How old, approximately, was
13 Mr. Johnson -- I'm sorry -- Mr. Buckler when you
14 got involved in the case?

15 A. I believe he was in his early 60s.

16 Q. I'm sure you looked at blood lead levels
17 for Mr. Buckler.

18 A. Yes, I did.

19 Q. And what were those levels,
20 approximately?

21 MR. LANCIOTTI: Objection.

22 I'm not sure if Dr. Graziano can
23 disclose confidential medical information of -- of
24 Mr. Buckler here.

1 THE WITNESS: I agree. I'm not sure
2 where this falls under HIPAA. But should I be
3 revealing his records?

4 BY MR. TER MOLEN:

5 Q. Okay. We'll go about this in a
6 different way, Doctor. I understand the concern.

7 Is it fair to say that -- well, you
8 would characterize his exposure as occupational
9 exposure, right?

10 A. That's correct.

11 MR. LANCIOTTI: Objection to form.

12 Q. Okay. And is it fair to say that his
13 blood lead levels, Doctor, were above
14 15 micrograms per deciliter?

15 A. Yes.

16 MR. LANCIOTTI: Same objection.

17 MR. STERN: Object to form; foundation;
18 violations of federal law by way of disclosure.

19 BY MR. TER MOLEN:

20 Q. Okay. I think you answered "yes" to
21 that question. Is that correct, Doctor?

22 A. That's correct.

23 Q. Okay. Was that case resolved?

24 A. It settled before going to court.

1 Q. Okay. Did you examine the plaintiff in
2 that case?

3 A. No, I did not.

4 Q. Did you receive any records regarding
5 the plaintiff in that case?

6 A. Yes, as I recall, I did.

7 Q. Did you become aware of any other
8 experts retained by plaintiffs in that case?

9 A. I recall -- I probably did, but I
10 couldn't tell you who they were.

11 Q. Okay. And, Doctor, approximately how
12 many other cases besides the Buckler versus
13 Johnson case have you testified in?

14 A. In my -- I'm in my 49th year of my
15 academic career, and I would say it's six or seven
16 cases. I had many opportunities along the way to
17 get involved. I was department chair and
18 associate dean and was running many research
19 operations and always to "Thank you, but no thank
20 you." Three years ago -- I'm ramping toward
21 retirement. In fact, in two months from now, I
22 will become a professor emeritus and will step
23 away as full-time faculty.

24 But in the last three years, '18, '19,

1 and '20, I moved to a half-time appointment. And
2 so I found myself with some time to begin to get
3 engaged as an expert.

4 Q. Thank you for that summary.

5 Can we -- I would like to work our way
6 back in time, Doctor, about these other six or
7 seven cases, if you can walk me through.

8 So let's start with the one that was
9 most recent in time, understanding that you've
10 already talked about the Buckler case.

11 A. Going back prior to that?

12 Q. Yes.

13 A. I recall one case where it -- I am a
14 professor of pharmacology. I worked early in my
15 career on drugs related to hematologic diseases.
16 And, in fact, my original appointments as a young
17 faculty member were in pediatric
18 hematology/oncology, and I was a member of the
19 American Society of Hematology.

20 The case was actually a prescription
21 misfill that killed the plaintiff. He was a
22 gentleman, former Navy officer who worked in
23 submarines, and he had been exposed to
24 radioactivity. And so he already had some

1 significant underlying disease -- hematologic
2 disease related to his radiation exposure.

3 And the pharmacy misfilled his
4 prescription with a drug that sounded like but
5 wasn't the appropriate drug. And that drug was
6 absolutely contraindicated for somebody who had
7 his underlying condition. And he proceeded to, in
8 short order, die.

9 And so I was called in as a
10 pharmacologist with expertise in hematologic
11 diseases.

12 And that case went to court, and
13 plaintiff's family was awarded a considerable sum.

14 Q. Okay. And I take it you testified -- I
15 think you said this, Doctor -- for the plaintiff
16 in that case?

17 A. I did.

18 Q. And "hematological" means blood related;
19 fair to say?

20 A. Sorry? Say again?

21 Q. "Hematological," a layman way of saying
22 that, would be blood related?

23 A. Yes. Blood diseases.

24 Q. Okay. Very good.

1 Approximately when was that case,
2 Doctor?

3 A. It's probably 10 or more years ago.

4 Q. All right. What was the next most
5 recent case that you can recall?

6 A. If we go back in time, I did a series of
7 cases -- let's see, my kids -- my son was in
8 college, so this goes -- my son was born in '69.
9 It goes back to the -- to, like, the late '80s or
10 early '90s. I worked with a law firm, Landman
11 Corsi Ballaine & Ford in New York City, and there
12 were several cases of childhood lead poisoning
13 over the course of two, three years. It was at a
14 point in time when I had two children in college,
15 and the extra income was helpful, frankly.

16 And in those cases, sometimes it was on
17 behalf of the plaintiff and sometimes it was on
18 behalf of the defendant. For example, I recall
19 one case where the child spent time, of course, in
20 his or her parents' home, but also spent time at a
21 nursery school, at grandma's house. And the
22 question there was whose lead was it that led
23 this -- I don't remember if it was a little boy or
24 girl -- but led this child to develop an elevated

1 blood lead.

2 And the attorneys that I was working for
3 were defending either the nursery school or
4 grandma's house, which it turned out to be not --
5 in my opinion, based on inspections of the
6 facility and so forth, not the source of lead
7 exposure.

8 So in that case, I was working with the
9 law firm defending a landlord, if you will.

10 Q. Okay.

11 A. In other cases -- and I think there were
12 four altogether. In some other cases, I was
13 working on behalf of the plaintiff, the
14 lead-poisoned child and family, actually assigning
15 blame, if you will, to this -- to whatever
16 apartment or building it was.

17 Q. Okay. And you had mentioned a
18 particular plaintiff -- a particular law firm in
19 New York City.

20 Was that the law firm with which you
21 worked on behalf of the plaintiffs?

22 A. Yes.

23 Q. For the one case where you were
24 representing a defendant, you mentioned that the

1 child in that case had developed an elevated blood
2 lead level, right?

3 A. That's right.

4 Q. What was that blood lead level,
5 approximately, if you can give me a range?

6 MR. LANCIOTTI: Objection; foundation.

7 A. I cannot.

8 MR. LANCIOTTI: And to the extent it
9 violates federal laws.

10 A. This was in the 1990s. I do not recall.

11 Q. Okay.

12 A. Yes.

13 Q. But by using the term "elevated," fair
14 to say more than 15 micrograms per deciliter?

15 MR. LANCIOTTI: Objection; foundation.

16 A. Yes.

17 Q. Okay. And the source of the blood lead
18 level in that case where you represented a
19 defendant, Doctor, was that from lead paint?

20 A. Yes, it was.

21 Q. And then the three or four cases where
22 you were representing the plaintiffs, Doctor, you
23 indicated you were identifying which structure was
24 the source of the lead exposure; is that right?

1 MR. LANCIOTTI: Objection to form.

2 A. So part of -- part of my role was to
3 look at inspections done by whatever department of
4 health it was, inspections of the home, and to
5 look at what they had uncovered. And part of it
6 was actually simply to give an opinion about
7 plausibility of the health effects that had been
8 observed in the children. And that's -- yeah.

9 Q. Okay. That's helpful.

10 In the cases where you were working on
11 behalf of the plaintiff that we're discussing here
12 with respect to lead exposure, those were all lead
13 paint cases, Doctor?

14 A. Yes, they were.

15 Q. Okay. And the blood lead levels in
16 those cases, Doctor, were all greater than
17 15 micrograms per deciliter?

18 MR. LANCIOTTI: Objection; form and
19 foundation.

20 A. Yes, they were.

21 Q. Are there other cases that you can
22 recall, Doctor, in which you've testified as an
23 expert?

24 A. No.

1 Q. And in the cases where you were
2 representing the plaintiff regarding lead that we
3 were discussing, Doctor, did you personally
4 examine any of the plaintiffs?

5 A. No, I did not.

6 Q. Did you receive medical records
7 regarding any of the plaintiffs?

8 A. Yes, I did.

9 Q. To your knowledge, Doctor, has a court
10 ever excluded all or part of any of your opinions?

11 A. No, they have not. Never.

12 Q. Have you ever testified as an expert
13 with regard to arsenic, Doctor?

14 A. No, I have not.

15 Q. Okay. And is it fair to describe your
16 current focus as focusing on arsenic?

17 A. Yes. For the last 20 years or so. As
18 you may know, I worked primarily in Bangladesh but
19 also in the state of Maine, where
20 naturally-occurring arsenic in drinking water --
21 in groundwater used for drinking purposes has led
22 to health effects in adults and children.

23 That said, though, however, lead --
24 blood lead -- because we learned that arsenic,

1 like lead, has adverse effects on cognitive
2 function, neuropsych performance, we would, to the
3 extent possible, also measure lead in blood, which
4 became a covariant, if you will, in unraveling the
5 consequences of arsenic on cognition. So we had
6 to control for, in many of my published works, for
7 lead.

8 So I haven't abandoned lead by any
9 stretch.

10 Q. I understand. And I appreciate that
11 explanation.

12 You've been the head, if I understand
13 correctly, of a particular group that's funded
14 through the department in which you work called
15 the Superfund program; is that right, Doctor?

16 A. So I lead -- I'm phasing out. I've
17 passed the baton just recently, but I lead a team
18 of roughly 15 scientists across Columbia
19 University, in public health, in medicine,
20 pediatrics, in the geosciences. And we were
21 funded in April of 2000 to conduct what was
22 originally a set of seven research projects. It
23 was called "Health Effects and Geochemistry of
24 Arsenic and Lead." Eventually it morphed into

1 "Health Effects and Geochemistry of Arsenic and
2 Manganese," which occurs in the Bangladesh
3 drinking water.

4 And so we were funded for 20 years. I
5 was director of that large interdisciplinary
6 initiative.

7 Q. Very good. Thank you.

8 And can you walk me through the
9 positions you've held at Columbia, please.

10 A. Sure. I came to Columbia in April 1979.
11 I had been, prior to that, at the
12 Rockefeller University in Manhattan and at Cornell
13 Medical School in Manhattan. Cornell, I was an
14 assistant professor of pediatrics and of
15 pharmacology.

16 And in '79, I was recruited to Columbia,
17 where I again had appointments in pediatrics and
18 pharmacology. I was recruited because, primarily,
19 I was working on the development of a drug to
20 treat childhood and occupational lead poisoning.
21 And the physician who recruited me,
22 Sergio Piomelli, we had collaborated before. He
23 was the head of pediatric hematology-oncology at
24 NYU, and he was being recruited to head

1 hematology-oncology. And he said, "Joe, I'd
2 really like you to come with me. I need" -- you
3 know, we had been doing terrific work
4 collaboratively. And he had also a keen interest
5 in lead poisoning. He's the one who discovered
6 one of the mechanisms whereby lead causes anemia,
7 inhibition of the synthesis of hem- -- of
8 hemoglobin.

9 In any case, he recruited me in '79.
10 And I had -- my laboratory was in the department
11 of pediatrics although my academic appointment was
12 really in pharmacology. I taught medical
13 pharmacology for 38 years to first-year medical
14 students.

15 And in 1985 or so, I actually moved my
16 laboratory from the department of pediatrics into
17 the pharmacology department, which was really at
18 that point a better home for my work. I actually
19 carried out a series of, first, laboratory studies
20 and then clinical trials in collaboration with my
21 partners in pediatrics, evaluating the safety and
22 efficacy of a drug now known as succimer, which is
23 now used around the world to treat childhood and
24 occupational lead poisoning.

1 We first did a trial -- we didn't want
2 to start in children. We started in men with
3 occupational lead poisoning. And we recruited men
4 from the Tri-state area. They ranged from house
5 painters to bridge painters to policemen who
6 worked at the firing range. And we established
7 the safety and efficacy of this drug, succimer, in
8 adults, and then moved on to conduct two trials of
9 the drug, first one in children with moderately
10 elevated blood leads, and then the second one in
11 children with more severely elevated blood leads.

12 I worked on that drug for 14 years. And
13 as I approach retirement and I reflect on my
14 career, that's one of the things I'm most proud
15 of. It was an orphan drug, so to speak. Drug
16 companies weren't interested in developing a drug
17 for a condition that was declining over time
18 because we got rid of lead in paint and we got rid
19 of lead in gasoline.

20 And so the drug was developed virtually
21 entirely with money from NIH, National Institutes
22 of Health, and it's a rare example of such a drug
23 developed with government money.

24 But the drug was approved by the FDA in

1 1991.

2 I'll come back to my career, because my
3 career had a shift in 1991.

4 But when the drug was approved, I
5 went -- if I may, I walked into my laboratory, the
6 people who had worked with me for 14 years, and I
7 told them, "Sit down. I have news. Just learned
8 that FDA approved the drug."

9 And I like telling this story to
10 students. What do you think they did? They all
11 started crying. It was such an emotional thing
12 after 14 years. I often tell students, "Science
13 is the ultimate in delayed gratification, you
14 know, 14 years of work."

15 But I will come back to 1991.

16 But to jump ahead, just to finish this
17 story with the drug, in 2013, I got a phone call
18 from a Reuters reporter who had just been to
19 Nigeria where there was an outbreak of fatal lead
20 poisoning due to what they call "artisanal gold
21 mining." There was a pit mine -- a large pit mine
22 in Nigeria where the ore also contained lead. And
23 poor people would go into the pit mine and steal
24 the ore, basically, and bring it home and process

1 it. And in the process of doing that, the lead
2 was disseminated into their villages.

3 And Doctors Without Borders actually
4 discovered these villages that were off the grid,
5 so to speak, when they were going around doing
6 well-baby vaccinations.

7 To cut to the chase, Doctors Without
8 Borders used my drug -- the drug to treat hundreds
9 and hundreds of cases, and it led to a reduction
10 in the mortality rate from 42 percent to
11 2 percent.

12 So they eventually, Doctors Without
13 Borders, petitioned the World Health Organization
14 to add the drug to the so-called list of essential
15 medicines. So it became the 66th drug on the list
16 of essential medicines. So if I were to go set up
17 a clinic in a pharmacy in some obscure part of
18 this planet, I would stock that pharmacy with the
19 list of essential medicines so you have drugs to
20 treat anything -- any condition that walks in the
21 door. So I'm proud of that.

22 But back to 1991, in the mid-'80s -- I'm
23 sorry. I have to go back one step further.

24 1978, while I was at Cornell Medical

1 School, I was asked to be a consultant to the
2 World Bank, which was lending money to the
3 renovation of a lead smelter in the former
4 Yugoslavia in what is now the Republic of Kosovo.
5 I was invited, in part, because of my work on
6 lead. The lead drug was now getting some
7 attention. And a bank cannot lend money to any
8 project that would become an environmental health
9 hazard to the community.

10 Q. Doctor, if I could just stop you for a
11 minute to make sure I'm following the timeline
12 here. I'm sorry. But you mentioned the drug was
13 approved in 1991, right?

14 A. That's right.

15 Q. And I thought I heard you -- and I may
16 well have been mistaken -- that you were retained
17 as a consultant by World Bank in 1978?

18 A. That's right.

19 Q. Okay. And I'm just trying to reconcile
20 the approval of the drug with the timing of your
21 retention when you're linking that to the drug, if
22 you don't mind explaining.

23 A. Not at all, no.

24 There was another faculty member at

1 Cornell, a man named Ernst Friedheim, who was
2 very, very much senior to me. And quite frankly,
3 he was the one who the bank came to engage and
4 bring on as a consultant to the bank. He then
5 asked me if I would join him. And so I was the
6 caboose, if you will, on this duo who went to the
7 former Yugoslavia. And we conducted -- and you'll
8 see why I'm telling this story in one moment.

9 We conducted a survey with physicians in
10 that mining town, a survey of blood lead
11 concentrations in children who had been exposed to
12 the legacy of the smelting operation. And,
13 indeed, they had a very high rate of elevated
14 blood lead concentrations. Very high lead
15 concentrations, in the 40s and 50s.

16 And what I'm getting at is that
17 collaboration with physicians in the former
18 Yugoslavia led to my first engagement in the field
19 of public health -- of environmental health. I
20 came home and I gave a grand rounds in pediatrics
21 to the pediatrics department at now -- it was by
22 now '79 -- at Columbia. It was my new home. And
23 it was -- "Diagnosis and Treatment of Lead
24 Poisoning" was the title. Childhood lead

1 poisoning. And in the audience was a professor of
2 epidemiology, Zena Stein. Very famous professor.
3 I won't go into her history.

4 But when -- in the last 10 minutes of my
5 grand rounds, I told this little story about,
6 "Hey, I was just in Yugoslavia in this town where
7 there's this rampant lead poisoning due to mining
8 activities."

9 And at the end of it, she came over to
10 me and she grabbed me by the lapel and she said in
11 a very endearing way, "Now, you come with me,
12 young man, because I work on mental disabilities
13 in children." And the WHO had just declared lead
14 exposure as being the number one preventable cause
15 of mental disability in children.

16 So she formed a working group in 1983
17 that included myself, an epidemiologist, a
18 pediatrician, a biostatistician, a research
19 psychologist. And we met weekly for a year
20 because she, and then I, wanted to develop a
21 strategy for studying children in that mining
22 town. Because at the time, it was not as well
23 known as it is today, as I write in my report now.
24 It was still up for grabs as to whether lead was

1 causally related to deficits in child
2 intelligence, among other things. And it was that
3 collaboration -- and so we wrote an NIH proposal.
4 I was the principal investigator. She was the
5 lead epidemiologist. And we got funded. And we
6 began one of the seven large prospective studies
7 at the time that followed children actually from
8 before birth -- we recruited pregnant women, 2,000
9 pregnant women, and we followed them through the
10 birth, and then we followed a subset of those
11 births out through age 12.

12 Because of that work, which was really
13 public health -- it was no longer pharmacology --
14 my career actually took a turn toward public
15 health -- Zena, the epidemiologist, actually threw
16 my name into the hat when the position of chairman
17 of the department of environmental health sciences
18 became open. She nominated me to become chair.

19 And so, indeed, in 1991, I was recruited
20 by our late dean, Allan Rosenfield, to move across
21 the street, if you will, from the medical school
22 to the school of public health. And I assumed the
23 role as chairman of the department, which I held
24 for 12 years. I stepped down, and then I was

1 called back as interim chair at some point along
2 the way.

3 So that's the trajectory of my career at
4 Columbia. When I stepped down as chairman, the
5 dean asked me to assume the role of associate dean
6 for research. He said essentially, "I still want
7 you at my table." And so I assumed that role,
8 which I had for a period of seven years.

9 Q. Okay. Thank you, Doctor. That's a very
10 interesting and thorough summary.

11 I'm going to go back in time a little
12 bit here and just maybe restate some things in my
13 own words to make sure I understand.

14 So pharmacology, that's -- fair to say
15 that's the study of drugs?

16 A. Correct.

17 Q. And --

18 A. If I may add one more thing?

19 Q. Go ahead.

20 A. It's also the study of the adverse
21 effects of drugs, not just the efficacy of drugs.
22 In the old days, pharmacology departments were
23 known as the department of pharmacology and
24 toxicology.

1 Q. Okay. Fair point.

2 To study the drugs and their effects on
3 people, whether they're positive or adverse, fair?

4 A. Right. People and animals. Yeah.

5 Q. And you mentioned you had developed with
6 funding from NIH and help from, it sounds like, a
7 variety of colleagues and students, a drug that
8 you pronounced -- is it succisoma?

9 A. Succimer.

10 Q. Succimer.

11 Do you mind spelling that for us? I
12 think Sara would appreciate that.

13 A. S-U-C-C-I-M-E-R.

14 Q. And you mentioned that it's a treatment
15 for lead poisoning; is that right?

16 A. Yes. It's what's called a chelating
17 agent.

18 Q. Okay.

19 A. C-H-E-L-A-T-I-N-G.

20 Q. And I was going to ask you about that.
21 Chelating agents, in general, in layman's terms,
22 they're designed to help rid the body of lead,
23 right?

24 A. Uh-huh.

1 MR. LANCIOTTI: Objection; form.

2 A. Chelating agents are designed to rid the
3 body of lead or other toxic metals.

4 Q. Understand.

5 A. My own work on chelating agents actually
6 began when I was working on hematological
7 diseases, diseases like sickle cell disease,
8 Cooley's anemia, where a subset of those patients
9 accumulate excess iron. My work originated --
10 work trying to develop drugs, chelating agents,
11 for iron overload.

12 Q. I understand. Thank you.

13 And there are -- for children, there are
14 risks with chelation, correct?

15 MR. LANCIOTTI: Objection; form and
16 foundation.

17 A. All drugs are toxic. The first line in
18 an opening class of medical students. So, sure,
19 all drugs have risks.

20 Q. Well, for children, the chelation
21 process means that their bodies are shedding a
22 number of substances that they might need to
23 develop.

24 Is that fair or not?

1 MR. LANCIOTTI: Objection; form and
2 foundation.

3 A. Well, that's a good point. And the
4 drugs that were available before succimer, a drug
5 like EDTA, was not specific for lead. It removed
6 lead, but it also removed zinc and copper and
7 iron. So the problems with the earlier drugs is
8 they were not specific and they led to the
9 depletion of essential minerals.

10 One of the attractions of succimer is
11 that it only removes heavy metals. It removes
12 lead, it removes arsenic, it removes Mercury, but
13 it doesn't touch the essential minerals.

14 Q. Okay. Very good. I can see why that
15 would have been an improvement on what was
16 available previously, Doctor.

17 A. And, if I may, succimer is an oral drug.
18 It's a pill. EDTA was an injectable drug. So
19 children would have to be hospitalized. The
20 case -- for example, Doctors Without Borders in
21 Nigeria, they couldn't hospitalize anyone to get
22 EDTA. So having -- the benefit of having an oral
23 medication was important.

24 Q. Appreciate that. Thank you.

1 And what blood lead level would be
2 required, in your view, before administration of
3 succimer would be appropriate?

4 A. The blood lead that's required -- and
5 this is agreed upon by pediatricians across the
6 country -- is a blood lead of 45 micrograms per
7 deciliter.

8 Q. Okay. In describing some of your
9 earlier work, you indicated that there were -- you
10 distinguished between individuals who had
11 moderately elevated blood lead levels and
12 seriously elevated blood lead levels.

13 Do you recall that?

14 A. I do.

15 Q. Can you explain what you mean in
16 whatever way is easiest for you, perhaps in terms
17 of range, what you mean by moderately versus
18 seriously?

19 A. Sure. I wish I had gone back and looked
20 at the papers there from the mid-1970s. But
21 moderately elevated, I believe we recruited
22 children with blood leads between 30 and 50, or
23 thereabouts, and the severe case, the subsequent
24 clinical trial, was in children with blood lead

1 concentrations of 50 and above.

2 Q. Okay. Thank you.

3 And just to follow your trajectory at
4 Columbia, Doctor, you remained as dean, then, of
5 the school of public health through approximately
6 2003, 2004?

7 A. Not dean.

8 Q. I'm sorry. Go ahead.

9 A. Associate dean for research. One of
10 many associate deans. And I retained that
11 position until, frankly, after we got a new dean.
12 I loved working for Allan Rosenfield. He was
13 just -- he was the person who recruited me in the
14 first place. He died, gosh, in -- about 15 years
15 ago, something -- and then it was logical for the
16 new dean to have her own people in place.

17 Q. Sure. Sure. Understand.

18 And I misspoke, Doctor. You were the
19 chair of the department of public health from --
20 at Columbia from approximately 1991 through 2003
21 or 2004?

22 A. The name of the department was the
23 department of environmental health sciences.

24 Q. Okay.

1 A. From 2000 until 2001, almost -- sorry --
2 yeah, 2001 or '2. I would have to look at my CV.

3 Q. Okay. Terrific.

4 And so you -- in approximately 1991,
5 then, your title changed from being a professor of
6 pharmacology to a professor of environmental
7 health sciences; is that right?

8 A. Yes. But I retained my professorship in
9 pharmacology and I continued to teach first-year
10 medical students through all those years. I just
11 stopped teaching first-year medical students,
12 pharmacology, just -- when I went to half-time,
13 just a few years ago.

14 Q. Okay. Thank you.

15 You are not an epidemiologist, correct?

16 A. That's correct, though I have, as I
17 mentioned, collaborated with world-class
18 epidemiologists since the early '80s. My late
19 wife was an epidemiologist.

20 Q. There's host collaboration.

21 A. Yes.

22 Q. And when you collaborate with somebody,
23 they bring their expertise and then you bring your
24 expertise; fair to say?

1 A. Fair to say.

2 Q. And like your work that you've described
3 as focusing on arsenic for the last 15, 20 years
4 or so, you'd agree that your publications for the
5 last 15 years or so have focused on arsenic?

6 A. Primarily on arsenic, but in the later
7 publications, on mixtures of metals.

8 One of -- including lead.

9 One of the challenges, you know, we are
10 all exposed to many, many environmental toxicants.
11 And one of the challenges over the years -- and we
12 all study things one element at a time, but all
13 realizing that no child is exposed to just one
14 substance.

15 And it was about seven or eight years
16 ago that the director of the National Institute of
17 Environmental Health Sciences, Linda Birnbaum,
18 introduced as part of the strategic plan of her
19 institute, NIEHS, which is one of the NIH
20 institutes, the push to develop statistical
21 methods to be able to study mixtures -- what we
22 call mixtures. And those methods have evolved.
23 In fact, there are faculty in my department who
24 are at the forefront of developing new statistical

1 methods.

2 So in the past few years, my work
3 studying arsenic in lead and manganese and cadmium
4 in children in Bangladesh has actually involved
5 new statistical methods -- not -- you know, I'm
6 not the statistician, but involved new
7 statisticians so that one can actually look at
8 this, what is the impact of the four metals and
9 which one is the bad actor, which one's next, and
10 next.

11 Is that fair? So, again, I'm a metal
12 toxicologist. It's not -- it's not as though I
13 move from lead to arsenic and abandon everything
14 I've done in the past.

15 Q. I understand.

16 You agree that your work over the last
17 15, 20 years -- I heard some background noise
18 here. Let me start over again.

19 I understand that you agree that your
20 work over the last 15 or 20 years is focused on
21 arsenic, right?

22 A. Yes.

23 Q. And the different -- the mixtures you're
24 talking about, I think what you're doing, at least

1 in part, Doctor, is introducing the concept of
2 confounders?

3 MR. LANCIOTTI: Objection; form;
4 foundation.

5 A. Yes. You could consider a mixture of
6 metals to be introducing confounders,
7 considering -- in a novel way, considering
8 confounders.

9 Q. Right.

10 Meaning that different metals can have
11 similar potential effects on humans, right?

12 MR. LANCIOTTI: Objection; form and
13 foundation.

14 A. Right.

15 Q. Okay. Doctor, in your report, you
16 note -- I can put this up if you want me to, but I
17 suspect you'll recollect this, but you can tell me
18 if I'm wrong -- in your report, you note that
19 you've gone out of your way not to cite your own
20 publication record.

21 And did you recall writing that?

22 A. I do.

23 Q. Okay. And why did you go out of your
24 way not to cite your own papers?

1 A. Largely because they involved children
2 with very, very high blood lead concentrations,
3 you know. We -- again, we wouldn't use succimer
4 to treat children with blood leads less than 45,
5 so why go there?

6 The work in Yugoslavia, on the other
7 hand, is one of the seven cohort studies that went
8 on simultaneously around the world. It involved
9 both children in the smelt- -- in the mining town
10 and children in a nonexposed town who, in
11 Pristina, P-R-I-S-T-I-N-A, Pristina, the capital
12 city of Kosovo, where they had very low blood
13 leads. In fact, that was one of the attractions
14 of -- for the funders to fund this, because we had
15 children in two towns, one town with very low
16 blood lead concentrations and another town with
17 high.

18 The low blood concentrations in Pristina
19 were largely due to the fact that Yugoslavia was
20 one of seven countries that signed a treaty in the
21 1920s to ban lead-based paint. So they didn't
22 have lead-based paint.

23 And so the blood lead concentrations in
24 Pristina were much lower than blood lead

1 concentrations in children in New York City.

2 Q. That's interesting.

3 And so the blood lead levels of the
4 children in Pristina, then, did those blood lead
5 levels -- that was your control group; is that
6 fair to say?

7 A. That's fair to say.

8 Q. Okay. Well, we'll come back to that in
9 just a second.

10 And, Doctor, I'm glad you mentioned
11 the -- you mentioned that you were buttonholed, if
12 you will, by the -- an epidemiologist after your
13 talk in the late 1970s and then that lead to your
14 getting funding working with her for this cohort
15 study. Right?

16 A. That's right. But I was the lead
17 principal investigator.

18 Q. Okay. And this is one of the, I think
19 you said, seven cohort studies that were being
20 conducted in different parts of the world?

21 A. That's right.

22 Q. Okay. And this cohort study that you
23 were the lead on was in Yugoslavia, right?

24 A. Right.

1 Q. Okay. And is it fair to say, Doctor,
2 that the data from this cohort study was then
3 included in subsequent studies, including the 2005
4 study, I think it's called a pool study, by
5 Dr. Lanphear?

6 MR. LANCIOTTI: Objection; form and
7 foundation.

8 A. That is correct.

9 MR. TER MOLEN: Okay. Why don't we put
10 up and we'll mark as Exhibit 5 the study, this
11 1982 study from Yugoslavia. Okay?

12 - - -

13 (Graziano Exhibit 5 marked.)

14 - - -

15 MR. TER MOLEN: Great. Thank you, Sam.
16 Let's go back to the beginning here.

17 BY MR. TER MOLEN:

18 Q. You're the -- just looking at the top
19 here, you're the second author identified on this
20 study; is that right, Doctor?

21 A. That is correct.

22 Q. Okay. And this is the study that you
23 were referring to, or this relates to the cohort
24 study that you were describing in Yugoslavia; is

1 that right?

2 A. That is not correct.

3 Q. Okay.

4 A. No. This -- this paper relates to the
5 visit that I made with funding from the
6 World Bank. And it was at that time that I met
7 Dusan Popovac, the first author, who was a medical
8 doctor of some renown -- of renown. And this is
9 describing the survey of blood lead concentrations
10 we did in the smelter town that actually took
11 place probably in '78 or '79.

12 Q. Okay. How is this different from the
13 study you described earlier?

14 A. This is different because this was not
15 a -- this was not a study that had a lot of
16 thought going into the design. And by that, I
17 mean we went into, with permission, clinics where
18 children were coming in for either well childcare
19 or they had a runny nose or some such thing. So
20 it was what's called "a convenience sample." It
21 was not a carefully mapped-out strategy to choose
22 children with high, children with low. We did --
23 we did take blood samples from children in the
24 same two towns, but -- so that's what this is.

1 Q. Okay. And when you say you did take
2 blood lead levels in the same two towns, you mean
3 the same two towns that were included in your
4 longitudinal cohort study, right?

5 A. Correct.

6 Q. Okay. So why don't we --

7 MR. TER MOLEN: If we can go to Table 1
8 in this study, Sam, if you don't mind.

9 Thank you.

10 Can we -- yeah, thank you.

11 Q. Can you see that, Doctor?

12 A. I can. I haven't looked at this in a
13 long time.

14 Q. Perfect.

15 And so just looking at the blood lead
16 levels for the two different cities, you see
17 the -- under the -- for 1978 -- as you said, this
18 relates to 1978, right?

19 A. That's right.

20 Q. Okay. When you look at the "Exposed
21 Area Residents" columns, and I guess there's also
22 some samples from 1980, but looking at the 1978
23 column, you see that the exposed levels range from
24 approximately 27 to 50 micrograms per deciliter

1 blood lead level; is that right?

2 A. That's right.

3 Q. Okay. And then in 1980, it's
4 approximately 35 to 46; is that right?

5 A. That's right.

6 Q. And then the nonexposed, if you go back
7 to the column on the far left, that's taken from
8 the same town in Yugoslavia that you were using
9 for your control group, right?

10 A. Right.

11 Q. And those blood lead levels range from
12 6.8 micrograms per deciliter to 10 micrograms per
13 deciliter blood lead level, right?

14 A. That's right.

15 Q. Okay. So even in today's world, Doctor,
16 we would -- well, in today's world, would you
17 characterize even the nonexposed control blood
18 lead levels as high?

19 MR. LANCIOTTI: Objection to form.

20 A. One needs to keep in mind that leaded
21 gasoline was still in use at this period of time
22 in former Yugoslavia. And so, you know, these are
23 high by comparison to the modern day, where we no
24 longer use lead in gasoline.

1 Q. Understand.

2 Going back at that point in time,
3 Doctor, people of my age and your age all had much
4 higher blood lead levels, correct?

5 A. That is correct.

6 MR. LANCIOTTI: Objection; form and
7 foundation.

8 A. That is correct.

9 Q. Doctor, I mentioned to you that I
10 represent a company called VNA, also known as
11 Veolia North America.

12 Have you heard of Veolia North America
13 before you got involved in this litigation?

14 A. No, never.

15 Q. Doctor, in connection with your opinions
16 in this case, did you review the -- well, did you
17 review a report that was prepared by a commission
18 appointed by then-Governor Snyder of Michigan that
19 was investigating the causes of the Flint water
20 crisis?

21 A. I believe I did. Can you tell me more
22 about what you're referring to? It was a
23 commission that reached some recommendations; am I
24 correct?

1 Q. It was a commission that was studying
2 how the Flint water crisis occurred and making
3 various findings, and I think also some
4 recommendations, but more so making findings as to
5 essentially how it happened.

6 A. I believe I read that, and I believe I
7 referred to that. That's one of the references in
8 my report.

9 Q. Okay. Okay. Doctor, you agree that
10 you're not an expert in how to operate a water
11 treatment plant, right?

12 A. That's right.

13 Q. And you're not an expert in operating a
14 water distribution system, correct?

15 A. Correct.

16 Q. You're not an expert in the corrosion of
17 pipes used for the distribution of water, right?

18 A. I'm not an expert about that, but I am
19 certainly aware of issues. I'm aware of what
20 New York City did years ago to start to treat
21 water to lower water lead concentrations. I'm
22 aware of it, but I'm not an expert.

23 Q. Okay. And also, you're not an expert in
24 water chemistry; fair to say?

1 A. Right.

2 Q. In your report on Page 3 -- again, I'm
3 happy to show this to you if you'd like -- you
4 refer to a sequence of extremely poor engineering
5 and policy decisions that lead to the Flint water
6 issues.

7 Do you recall that?

8 A. I do.

9 Q. Okay. And you're providing that as
10 background information; are you not?

11 MR. LANCIOTTI: Objection; form.

12 A. As background information. The failure
13 to use anticorrosives. I am familiar with the use
14 of anticorrosives in the New York City water
15 supply, the addition of calcium orthophosphates to
16 coat pipes and prevent corrosion and the elution
17 of lead, if you will, into the water supply.

18 Q. I understand what you're saying, Doctor,
19 and I just want to be clear.

20 You have in your report in this case --
21 we've marked as Exhibit 3 various opinions that
22 we'll get to. One of my goals today is to make
23 sure I understand what are your opinions versus
24 what you're providing more as background here.

1 And I think you indicated that you're not an
2 expert in corrosion, you're not an expert in water
3 engineering.

4 So is it fair to say that you yourself
5 are not offering an opinion as to the cause of the
6 Flint water crisis?

7 A. The verbiage that I used in my report in
8 that regard is simply a reflection of what I read
9 in the --

10 Q. I understand.

11 A. -- report.

12 Q. You're repeating what others have said
13 as opposed to offering your own opinion, right?

14 A. That's correct.

15 MR. LANCIOTTI: Objection; form.

16 Q. Okay. Doctor, in your report, in
17 general, you cite to a number of scientific
18 studies that relate to lead exposure, right?

19 A. Right.

20 Q. And we'll talk more and get to a little
21 bit later here, you cite, for example, a 1979
22 study by a Dr. Needleman.

23 Do you recall that?

24 A. I sure do.

1 Q. And then you noted -- again, I'm happy
2 to show this to you, but -- if that's helpful --
3 you note there that his study is not definitive,
4 and then you have a parenthetical note, "because
5 of its cross-sectional study design."

6 Do you recall that phrasing?

7 A. Yes, I do.

8 Q. Okay. So this, I think, would be a good
9 time to then explain what you mean by that, if you
10 could for us, please.

11 A. Surely.

12 A cross-sectional study, as was the case
13 in the Needleman -- famous Needleman tooth lead
14 study, studies the exposure and the outcome at the
15 same moment in time. And as such, it fails to
16 meet one important criteria one of the so-called
17 Bradford Hill criteria for causality, and that is
18 temporality. How could it be that today's tooth
19 lead influences a child's performance in its
20 classroom -- in the classroom?

21 So one needs -- to develop for
22 causality, one needs to have measured the exposure
23 before you look at the outcome. And I recall a
24 meeting essentially at NIH when Needleman was

1 presenting this work and Needleman was a very --
2 how can I say -- he had a presence, and he pounded
3 the table and has said -- to the experts for the
4 paint companies and the gasoline companies, he
5 essentially said, "Aha, we've got you now, you
6 know, look at this powerful evidence."

7 And they said, "No, Dr. Needleman,
8 you've got it all wrong. Stupid kids put their
9 hands in their mouths. Stupid kids ingest more
10 lead," which I always use in the classroom because
11 it is a great teaching example of the limitations
12 of a cross-sectional study. Really, you can't
13 tell which is cause and which is effect.

14 That well-known limitation of
15 cross-sectional studies led the National
16 Institutes of Health to fund the Yugoslavic study,
17 to fund the Cincinnati longitudinal cohort, to
18 fund the Boston longitudinal cohort and so on.
19 And so, yeah, the cross-sectional study in itself
20 does not prove cause and effect.

21 Q. Okay. That's helpful, Doctor. Thank
22 you.

23 And maybe just to summarize in more
24 layman's terms, a cross-sectional study is just

1 looking at a snapshot in time, one moment in time,
2 right?

3 A. That is right.

4 Q. And a longitudinal study, which I think
5 you used that term earlier, is a study that looks
6 at a cohort of individuals over a period of time;
7 is that fair to say?

8 A. That's fair to say.

9 Q. Okay. And for purposes of establishing
10 causation, you would agree that a longitudinal
11 study is more relevant and useful than a
12 cross-sectional study, right?

13 MR. LANCIOTTI: Objection; form and
14 foundation.

15 A. Correct.

16 Q. Doctor, I'd like to talk a bit about the
17 bellwether plaintiffs that bring us here today.

18 You indicated you understand that you
19 were retained by the bellwether plaintiffs, right?

20 A. Right.

21 Q. And you were given -- or at least you
22 had access to at one point in time, Doctor --
23 deposition transcripts for four guardians of
24 bellwether plaintiffs, right?

1 A. Right.

2 Q. And it's fair to say, Doctor, that you
3 do not discuss any bellwether plaintiffs in your
4 report, Exhibit 3, right?

5 A. That's right.

6 Q. Sitting here today, Doctor, do you know
7 if any of the bellwether plaintiffs had blood lead
8 testing done during the time frame 2014 to 2015?

9 A. I do not.

10 MR. LANCIOTTI: Objection; form.

11 A. I do not.

12 Q. Sitting here today, do you know whether
13 the homes in which any of the bellwether
14 plaintiffs lived had lead service lines?

15 MR. LANCIOTTI: Objection; form.

16 A. I do not.

17 Q. Sitting here today, do you know whether
18 the water in the homes of any of the bellwether
19 plaintiffs was tested for lead in the time frame
20 2014, 2015?

21 MR. LANCIOTTI: Objection; form.

22 A. No, I do not.

23 Q. And you're familiar, it sounds like,
24 Doctor, with the fact that in April of 2014, the

1 City of Flint changed its water source from
2 receiving water from the City of Detroit to
3 treating water from the Flint River?

4 MR. LANCIOTTI: Objection; foundation.

5 A. Yes, I'm familiar with that.

6 Q. And sitting here today, Doctor, do you
7 know whether any of the bellwether plaintiffs kept
8 drinking the water from the City of Flint after
9 that switch occurred in April of 2014?

10 MR. LANCIOTTI: Objection; form.

11 A. No, I do not.

12 Q. Doctor, you agree that every child in
13 America has some lead in their body?

14 MR. LANCIOTTI: Objection; form and
15 foundation.

16 A. Yes.

17 Q. And you agree the same is true for the
18 children in Flint before the water switch
19 occurred, right?

20 MR. LANCIOTTI: Objection; form and
21 foundation; outside the scope of this expert's
22 testimony.

23 A. Could you repeat the question?

24 Q. Sure.

1 MR. TER MOLEN: Sara, do you mind
2 reading that back?

3 (Record read as requested.)

4 A. I agree.

5 Q. Would the lead that they had -- let me
6 start over again.

7 Would the lead that the children in
8 Flint had in their bodies before the switch
9 occurred in April of 2014 have adversely affected
10 those children?

11 MR. LANCIOTTI: Objection; form and
12 foundation.

13 A. Yes.

14 Q. Do you agree, Doctor, that before the
15 switch of water sources occurred in April of 2014,
16 that there was already lead in the drinking water
17 of Flint residents?

18 MR. LANCIOTTI: Objection; form and
19 foundation; outside the scope of this expert's
20 testimony.

21 A. I cannot know that.

22 Q. I understand your response, Doctor, and
23 that's a good segue, then, to this question, which
24 is, can you describe for us what the primary

1 sources of lead exposure are in the United States?

2 A. Well, historically, the primary sources
3 have been lead paint. Until not so long ago, we
4 used lead in gasoline, and so there's lead in
5 dust. Historically, there was lead in food much
6 more than today because of the use of lead solder
7 in canned foods.

8 But the largest source of exposure for
9 children in the United States today is still the
10 legacy of lead paint, which endures in many, many
11 homes.

12 Q. Okay. I understand that lead paint is
13 the largest source of exposure. Then you'd agree
14 that over time, through lead paint deteriorating
15 or flaking off, that lead would also accumulate in
16 the soil?

17 A. Yes.

18 MR. LANCIOTTI: Objection; foundation.

19 A. Yes. In the exterior soil, yes.

20 Q. Yes, right.

21 And as you indicated, I think, through
22 lead paint deteriorating, lead also would
23 accumulate in dust within homes?

24 A. That is correct.

1 Q. Okay. And you mentioned that food has
2 been a concern for lead, in part, because of lead
3 solder in cans?

4 A. Yes. But that's largely historical.

5 Q. With respect to consumer products,
6 Doctor, do those present any concerns with respect
7 to lead?

8 A. There have been instances where pottery
9 coming from particularly Mexico, has had lead
10 paint on it. There have been relatively,
11 fortunately rare, instances of toys that have
12 appeared, usually from abroad, that have lead
13 paint on it. It's, again, lead paint, but on a
14 toy.

15 Q. Understand.

16 What about cosmetics?

17 A. There was a cosmetic called "kohl,"
18 K-O-H-L, which is a lead cosmetic that certain
19 cultures use, largely mid-eastern, I think. But,
20 yeah, there have been cases of lead in cosmetics.

21 Q. What about medicine?

22 A. Not that I know of.

23 Q. Smoking. Doctor, is smoking a source of
24 lead?

1 A. Smokers have higher blood leads than
2 nonsmokers.

3 Q. And secondhand smoke is also a source of
4 lead exposure?

5 A. You know, I'm not sure about that.
6 Smokers, because of their hand-to-mouth activity,
7 have the opportunity to ingest lead dust just from
8 their repeated hand-to-mouth activity.

9 I'm honestly not sure about contribution
10 of secondhand smoke to lead exposure.

11 Q. Okay.

12 A. In children.

13 Q. Okay. You're familiar with
14 Dr. Bruce Lanphear, right?

15 A. Yes, I am.

16 Q. Okay. And, in fact, you were a
17 coauthor, is that right, of his 2005 paper?

18 A. That's correct.

19 Q. And Dr. Lanphear is an epidemiologist;
20 is that right?

21 A. Pediatrician and epidemiologist, yes.

22 Q. And he has focused on lead exposure
23 issues; is that right?

24 MR. LANCIOTTI: Objection; form and

1 foundation.

2 A. That is right.

3 Q. And would you agree that lead concerns
4 is an ongoing focus of his?

5 MR. LANCIOTTI: Objection; form and
6 foundation.

7 A. Yes, it is.

8 Q. Would you defer to Dr. Lanphear and his
9 opinions with respect to whether or not secondhand
10 smoke is a source of lead?

11 MR. LANCIOTTI: Objection; form and
12 foundation.

13 A. He's a rigorous scientist. If he says
14 it's a source, then I would -- but I would want to
15 read -- if there's some peer-reviewed publication,
16 I would want to read it --

17 Q. Sure.

18 A. -- before I buy in.

19 Q. Okay. Trust but verify. That's fair
20 enough, Doctor.

21 A. Yeah.

22 Q. Do children, in your experience, Doctor,
23 typically have exposure to lead from more than one
24 source?

1 A. Yes.

2 Q. And, Doctor, when was lead largely
3 phased out of the environment, at least in the
4 U.S., if you know?

5 MR. LANCIOTTI: Objection; form and
6 foundation.

7 A. Well, phased out of the environment?
8 You mean phased out of leaded gasoline?

9 Q. Well, we can take it in steps.
10 When was it that lead was phased out of
11 products in the U.S.?

12 A. It was largely during -- so blood leads
13 peaked in children in the United States around
14 1976, '77. And at that time, we were using leaded
15 gas and we were -- still lead paint. And a series
16 of public health measures over time led to the
17 banning of leaded gas, led to the banning of the
18 use of lead paint, banning of lead solder in cans.
19 And as a result, beginning in 1977 and onward to
20 today, blood lead concentrations in children in
21 the United States have declined.

22 I think those of us in the field, we
23 knew that leaded gasoline was a big source. But
24 all of us were somewhat thunderstruck by the rapid

1 decline in blood lead concentrations in children
2 across the country once leaded gasoline was
3 banned.

4 Q. And the leaded gasoline ban, Doctor,
5 that occurred, is it fair to say, in the late
6 1970s?

7 A. I think that -- yeah, yes.

8 Q. And is it fair to say, Doctor, that in
9 the later 1980s, there was a ban on lead in
10 products such as paint, such as fixtures for use
11 with plumbing, water source?

12 MR. LANCIOTTI: Objection; foundation.

13 A. I'd like to correct myself on the lead
14 in gasoline and then we'll come back to your
15 question.

16 When automobile makers start -- added
17 the catalytic converter to automobiles, that is
18 when there was a shift toward the use of unleaded
19 gasoline. You may recall -- you and I are old
20 enough -- that you would pull into the gas station
21 and there would be leaded gas and unleaded gas.
22 The unleaded gas was for the newer automobiles
23 because lead fouls the catalyst in the catalytic
24 converter.

1 The actual ban on leaded gasoline didn't
2 take place until years later.

3 So that inflection point, from the high
4 blood leads in 1977, coming down was due to a
5 gradual transition away from leaded gas, but then
6 there was -- then the policy was changed.

7 And now if you would repeat your next
8 question.

9 Q. That's fine.

10 So there was a -- bans on several
11 different products containing lead, it's fair to
12 say, that included lead gasoline, that included
13 lead in paint, that included using lead in
14 fixtures associated with interior home plumbing.

15 And all of those bans were in place by
16 the late 1980s; fair to say?

17 A. Fair to say.

18 MR. LANCIOTTI: Objection; form and
19 foundation.

20 A. Fair to say.

21 Q. Okay. And is it fair to say, Doctor,
22 that these towns with housing stock that largely
23 predates the 1990s are more likely to have lead
24 sources than newer homes?

1 MR. LANCIOTTI: Objection; form and
2 foundation.

3 A. Yes, that's fair.

4 Q. Okay. And are you aware, Doctor, that
5 the vast majority of homes in Flint were built
6 before 1990?

7 MR. LANCIOTTI: Objection; form and
8 foundation; outside the scope of this witness's
9 testimony.

10 A. Yes, I am aware of that.

11 Q. Okay.

12 A. I have -- I have visited Flint
13 many years ago. I've actually been there --

14 Q. Oh.

15 A. -- before any of this happened.

16 Q. Sure.

17 What was the occasion for the visit?

18 A. It's back when I was working on
19 hematologic diseases. One of the diseases I
20 worked on -- it's known as Cooley's anemia, it's
21 known as Mediterranean anemia, it's known as
22 thalassemia -- occurs in -- most commonly in
23 children of Greek or Italian descent. And there
24 was a community organization -- there was a --

1 quite a large cluster of such cases in Flint. And
2 there was a community organization that invited me
3 to speak about my work on chelating agents in --
4 for iron.

5 And so I was out there for a completely
6 different reason, but I have been there.

7 Q. That's very interesting.

8 Approximately what time frame was that,
9 Doctor?

10 A. That was 1978, '79, roughly.

11 Q. That's interesting.

12 Did you do any studies that related to
13 the folks in Flint?

14 A. No. I gave a talk.

15 Q. Yeah.

16 Okay. And you'd agree, Doctor, that
17 children who grow up in housing that predates 1990
18 are more likely to have higher blood lead levels
19 than children who grow up in newer homes?

20 MR. LANCIOTTI: Objection; form and
21 foundation.

22 A. Yes, I agree.

23 Q. On Page 2 of your report, Doctor -- and,
24 again, I'm happy to show it to you if you'd

1 like -- I think it's more background
2 information -- you talk about the history of
3 Flint, and you write that "Environmental pollution
4 descended on Flint, Michigan during the first half
5 of the 20th century when the highly successful
6 auto industry was producing batteries and paints
7 and other components for automobile production."

8 Do you recall that?

9 A. I do.

10 Q. And obviously that pollution included
11 lead, right?

12 MR. LANCIOTTI: Objection; foundation.

13 A. I don't know that it included lead. I
14 say that in my -- whatever it is, Page 2, echoing
15 comments from a colleague of mine at the School of
16 Public Health at Columbia, David Rosner. David is
17 a public health historian.

18 And I heard him give a grand rounds
19 lecture at Columbia when the Flint issue was
20 coming to the news and David was brought in to
21 give a kind of a history -- lecture about the
22 history. So I'm echoing David's -- and he is
23 world-class public health historian.

24 Q. Okay. I understand. You're -- you're

1 repeating comments from one of your colleagues who
2 is a historian.

3 You did use -- you did include in your
4 summary of sources of pollution the production of
5 batteries there in your report. And I think you
6 testified earlier today that you had, in fact,
7 been retained as an expert in a case recently,
8 right, where you were testifying on behalf of a
9 plaintiff who had a significant occupational
10 exposure to lead due to working in a battery
11 plant, right?

12 MR. LANCIOTTI: Objection; form.

13 A. Right.

14 Q. Okay. Is it fair to say, Doctor, you'd
15 expect that at least the production of batteries
16 would result in some lead pollution?

17 MR. LANCIOTTI: Objection; form and
18 foundation.

19 A. It would result in the production of
20 lead dust, which could be disseminated around the
21 factory.

22 Q. Okay. And from the factory into the
23 broader environment, wouldn't you expect?

24 MR. LANCIOTTI: Objection; form and

1 foundation.

2 A. Possibly.

3 Q. And are you aware, Doctor, that going
4 back to the 19th century, the City of Flint had a
5 municipal ordinance that required the use of lead
6 for the service line that was feeding water into
7 the home from the public distribution system?

8 MR. LANCIOTTI: Objection; form and
9 foundation; outside the scope of testimony.

10 A. I did read that in one of the documents,
11 perhaps the commission document. I'm not certain.

12 Q. Okay. And certainly the existence of a
13 lead service line for the water supply for homes
14 would be a basis for lead getting into the water.
15 Is that not the case?

16 MR. LANCIOTTI: Objection; form and
17 foundation.

18 A. That is the case.

19 Q. And you agree, Doctor, that children who
20 live in homes with lead paint are more likely to
21 be exposed to lead than children who do not live
22 in homes with lead paint?

23 MR. LANCIOTTI: Objection; form and
24 foundation; asked and answered.

1 A. Yes, I agree.

2 Q. Does the type of housing, in your
3 opinion, Doctor, affect exposure to lead paint?

4 A. What exactly do you mean by "type of
5 housing"?

6 Q. Well, there have been some studies --
7 and I had a discussion about this with
8 Dr. Lanphear not too long ago -- that indicate
9 that different kinds of housing, whether it be
10 rental housing, whether it be housing in poor
11 condition, are more likely, in his view, to lead
12 to exposure of children to lead paint. That's the
13 context, if that's helpful for you in answering
14 the question, Doctor.

15 A. I would agree that housing that is not
16 well maintained increases the likelihood that a
17 child could be exposed to lead paint, if there is,
18 in fact, lead paint in the residence.

19 Q. Okay. And by that, you mean that in a
20 well-maintained home, the lead paint would
21 generally be sealed or covered in ways that would
22 minimize exposure; is that right?

23 MR. LANCIOTTI: Objection; form and
24 foundation.

1 A. It's more likely to be encapsulated by
2 nonlead paint.

3 Q. And you agree, Doctor, that some homes
4 have lead paint on the exterior of the home?

5 MR. LANCIOTTI: Objection; foundation.

6 A. Yes.

7 Q. And you agree, Doctor, that on some
8 homes, there's lead paint on fences and garages?

9 MR. LANCIOTTI: Objection; foundation.

10 A. Likely, yes.

11 Q. And is it fair to say, Doctor, that the
12 more lead paint that there is in a home, that,
13 therefore, the higher the lead dose you would
14 expect to find in a child who lives in that home?

15 MR. LANCIOTTI: Objection; form and
16 foundation.

17 A. I would say there's a higher probability
18 that the child could get exposed. It doesn't
19 guarantee that exposure would take place, but it
20 increases the opportunity for exposure to occur.

21 Q. Okay. And my question, I think, is --
22 or the question I'm trying to ask, at least,
23 Doctor, is slightly different, and that is getting
24 to the level of the lead dose, if you will, right?

1 And so is it fair to say, Doctor, that
2 the more lead paint there is in a home, then the
3 higher the probability that a child living in that
4 home will have a higher lead dose?

5 MR. LANCIOTTI: Objection; form and
6 foundation.

7 MR. STERN: Object to form. He's
8 already testified that the quantity of lead
9 ingested by the child determines the dose, not the
10 level of lead inside a particular structure. He
11 just said it two seconds ago better than I did.
12 Asked and answered.

13 BY MR. TER MOLEN:

14 Q. You can go ahead and answer the
15 question, Doctor.

16 A. Could you repeat the question, please?

17 Q. Sure.

18 MR. TER MOLEN: Sara, do you mind
19 reading it back?

20 (Record read as requested.)

21 A. Yes. The higher -- there would be a
22 higher probability.

23 Q. You would agree, Doctor, that in an
24 urban area like Flint with the vast majority of

1 the homes being built in -- before 1990, that you
2 would expect the soil to contain lead?

3 MR. LANCIOTTI: Objection; form and
4 foundation.

5 A. Yes.

6 Q. And going back just briefly to the
7 homes, Doctor, just -- and, again, looking at a
8 city like Flint, you'd expect that from home to
9 home as you move through the City, there would be
10 great variation as to the amount of lead in any
11 particular home; is that right?

12 MR. LANCIOTTI: Objection; form and
13 foundation.

14 A. That's right. Depending upon the
15 conditions of the home.

16 Q. And with respect to water -- and by
17 "water," I mean drinking water being supplied by
18 the City -- you'd agree that whether or not
19 drinking water being supplied to any given home
20 contains lead depends on a variety of factors?

21 MR. LANCIOTTI: Objection; form and
22 foundation; beyond the scope of this witness's
23 testimony.

24 A. Can you ask that again, please?

1 Q. Sure. Let me maybe ask it a different
2 way.

3 In some homes, there is lead in the
4 drinking water. Would you agree with that?

5 MR. LANCIOTTI: Objection; form;
6 foundation.

7 A. Yes.

8 Q. Okay. What are the factors, in your
9 view, Doctor, that determine whether or not there
10 is lead in the drinking water of any particular
11 home?

12 MR. LANCIOTTI: Objection; form and
13 foundation.

14 A. The factors would include, for example,
15 whether there is lead pipe delivering water to the
16 home, whether the main -- the lead main linking
17 the water supply from the street to the house is a
18 lead main; the corrosion control employed by the
19 water supplier would have an impact on the
20 concentration of lead in the water from those lead
21 in pipes. It could involve the plumbing within
22 the house, the faucets and so forth.

23 I think that's all I can think of.

24 Q. Okay. Fair enough. That's a good

1 summary.

2 And so you would agree, Doctor, that
3 going from home to home in the City of Flint,
4 there could be great variation as to whether or
5 not any home had lead in its water, and if it did
6 have lead, how much lead there was; is that fair
7 to say?

8 MR. LANCIOTTI: Objection; form.

9 A. That's fair to say.

10 Q. Okay. And in this case, Doctor, it's
11 fair to say that you haven't looked at to what
12 degree, if any, any of the bellwether plaintiffs
13 have been exposed to lead from paint; is that
14 right?

15 MR. LANCIOTTI: Objection; form; asked
16 and answered.

17 A. That's right.

18 Q. And you've also not -- well, let me back
19 up here.

20 And sitting here today, Doctor, you're
21 not able to opine to what degree, if any, any of
22 the bellwether plaintiffs have been exposed to
23 lead from water; is that right?

24 MR. LANCIOTTI: Objection; asked and

1 answered.

2 A. That's right. I think we already
3 discussed that.

4 Q. Okay. You're familiar, I'm sure,
5 Doctor, with the term "dose"?

6 A. Yes.

7 MR. LANCIOTTI: Objection; foundation.

8 A. Yes, I am.

9 Q. Can you explain for us what you
10 understand that term to mean.

11 A. Dose is the quantity of a substance, be
12 it a drug, be it a toxicant, that one is exposed
13 to either by ingestion, inhalation, or dermal
14 absorption.

15 Q. Okay. And do you draw a distinction
16 between dose on the one hand and -- I'll use the
17 word "absorption," on the other hand?

18 MR. LANCIOTTI: Objection; form.

19 A. Absorption is something else.

20 Q. Let me use the term "uptake." Would
21 that help? Do you draw a distinction between the
22 term "dose" versus "uptake"? Is that helpful or
23 not?

24 MR. LANCIOTTI: Objection; form.

1 A. Well, let's just assume we're talking
2 about ingestion for a moment. Forget about air
3 and dermal.

4 The dose is the amount, the quantity
5 that one swallows. Absorption can influence the
6 fraction of that dose that actually enters the
7 bloodstream. So they are two different things.

8 Q. Okay.

9 A. Absorption can refer to what we call the
10 "bioavailability" of the dose.

11 Q. I think we're getting at the same point,
12 Doctor, and so apologies for my layman background
13 here. Okay? But to maybe come at this -- and if
14 you want to treat me as a particularly slow
15 student, feel free.

16 But to come at this, then, from another
17 direction perhaps, Doctor, the -- with respect to
18 lead, different individuals can be exposed to the
19 same level, if you will, of lead, but their bodies
20 might absorb different amounts from that exposure;
21 is that fair?

22 MR. LANCIOTTI: Objection; form.

23 A. That's totally fair.

24 MR. STERN: Objection to form; move to

1 strike the colloquy.

2 BY MR. TER MOLEN:

3 Q. Can you explain for us why there would
4 be a difference between exposure versus -- I'll
5 call it uptake. If you want to use a different
6 word, feel free.

7 MR. LANCIOTTI: Objection; form.

8 A. There's one classic explanation for that
9 with regard to lead, and that has to do with iron
10 deficiency. Children -- let me backtrack.

11 When one is iron deficient -- let me
12 backtrack once more.

13 We typically absorb a relatively small
14 fraction of the iron in our diets into the
15 bloodstream. It's usually on the order of
16 10 percent, except for red meat. But if you eat
17 your spinach, you're going to absorb only about
18 10 percent or less, perhaps.

19 If you are iron deficient, you absorb
20 much more, 20, 30 percent. And we know why. We
21 know -- on a molecular level, we know why.

22 When you're iron deficient, your body
23 recognizes that you're iron deficient, and your
24 GI -- the lining of your GI tract actually puts up

1 receptors for iron. There's a transporter called
2 "divalent metal transporter." And you up-regulate
3 that transporter in the lining of your gut. And
4 by that means, your body takes up more iron, and
5 that's a good thing.

6 The bad thing is it's not called the
7 iron transporter. It's called the divalent metal
8 transporter. It's not specific for iron.

9 So children with iron deficiency, by
10 virtue of the fact that they have up-regulated
11 their ability to pull in iron, unfortunately also
12 pull in other divalent metals, including lead.

13 So an example here is when I worked on
14 the succimer trials in children in New York City
15 with substantially elevated blood lead
16 concentrations, they often also had iron
17 deficiency. It was not uncommon for these two
18 conditions to co-occur.

19 So, yes, we vary in our ability to
20 absorb lead and any other metals.

21 Q. That was a great example, Doctor, and
22 that's exactly what I was getting at. Thank you.

23 And is it fair to say that for purposes
24 of the body's uptake, that lead mimics iron for

1 purposes of being absorbed by the body?

2 MR. LANCIOTTI: Objection to form.

3 A. Well, I don't know that it mimics iron.

4 It happens to have an affinity for that

5 transporter. If you limit your analogy to that

6 specific case, I would say yes. Once in the body,

7 lead does not tend to interfere with iron.

8 Q. I understand.

9 A. Yeah.

10 Q. Understand.

11 Okay. And so is it fair to say, Doctor,

12 that a child who is iron deficient, they are --

13 that child is more likely to absorb lead than a

14 child who is not iron deficient, fair?

15 A. Yes.

16 MR. LANCIOTTI: Objection; form and

17 foundation.

18 A. Fair.

19 Q. The same is true for calcium, correct?

20 MR. LANCIOTTI: Object to form and

21 foundation.

22 A. To a much lesser extent. Calcium --

23 there is a literature on calcium and lead

24 absorption. Children who are calcium deficient

1 could -- if the diet is deficient, and relatively
2 deficient in calcium, it can increase the
3 absorption of lead to a much less extent.

4 Q. Okay.

5 A. I would rank the iron deficiency
6 situation to be much more important than calcium
7 in the diet.

8 Q. Well, thank you. That's interesting.
9 That's helpful. I hadn't heard that before.

10 Would you agree, Doctor, that a child
11 who is calcium deficient is more likely to absorb
12 lead than a child who is not calcium deficient?

13 MR. LANCIOTTI: Objection; form;
14 foundation.

15 A. I don't know of a literature on children
16 with calcium deficiency. Calcium deficiency is
17 not a common thing. So I don't know of a
18 literature, per se, of children with calcium
19 deficiency. I do know of a literature about
20 calcium present in the diet influencing lead
21 absorption.

22 Q. And what is the upshot of that
23 literature, Doctor?

24 MR. LANCIOTTI: Objection to form.

1 A. That a giant -- and this is known from
2 animal studies as well, which we can do
3 carefully -- a diet that is relatively deficient
4 in calcium will allow lead absorption to proceed
5 at a faster rate or more extensive -- to a greater
6 extent.

7 Q. Okay. And so to ask my question
8 differently, in a child who has a diet that is
9 relatively deficient in calcium is more likely to
10 absorb lead than would a child whose diet is not
11 deficient in calcium, right?

12 MR. LANCIOTTI: Objection; form;
13 foundation; asked and answered.

14 A. I agree with that.

15 Q. Okay.

16 MR. LANCIOTTI: Mr. Ter Molen, we've
17 been going for close to two hours. Do you
18 anticipate arriving at a point where we can take a
19 short break?

20 MR. TER MOLEN: That's fine. Why don't
21 we take a break. Let's see. You said we've been
22 going for a while, Patrick. Let's come back --
23 and I want to get into one more point here -- but
24 let's come back at, say, five minutes after the

1 hour. Take a 10-minute break.

2 VIDEOGRAPHER: The time is 10:54 a.m.,
3 and we're off the record.

4 (Recess taken.)

5 VIDEOGRAPHER: The time is 11:06 a.m.,
6 and we're on the record.

7 BY MR. TER MOLEN:

8 Q. Doctor, can you describe some of the
9 variables that, in your view, affect a person's
10 dose of lead?

11 MR. LANCIOTTI: Objection; form and
12 foundation.

13 A. Age. Children -- young children have
14 hand-to-mouth activity that leads them to ingest
15 more lead; the home environment -- quality of the
16 home environment, as we've touched on already; the
17 housing stock, we've touched on.

18 In the past, when we used leaded
19 gasolines, distance from the highway -- from the
20 nearest highway; the nutritional variables that
21 we've talked about, iron, and to a lesser extent,
22 calcium.

23 That's what comes to mind.

24 Q. Okay. Thank you. That's helpful.

1 And you mentioned home environment and
2 then separately, the housing stock. And I think I
3 understand housing stock, and by that, I think you
4 mean whether or not the home contained materials
5 that contained lead; is that right?

6 A. I was referring to the age of the homes,
7 as we've already talked about.

8 Q. I understand.

9 And I want to make sure I understand the
10 term "home environment," if you can explain that
11 term for me.

12 A. I mean the conditions, the repair -- the
13 extent of repair or disrepair of the home.

14 Q. Very good.

15 What about genetic factors? Does that
16 play a role?

17 A. No, not really. There's some small
18 literature on -- that is not substantially
19 convincing regarding one polymorphism from one
20 particular protein. But, no, genetics are not
21 really a big factor.

22 Q. If you were evaluating whether children
23 in a particular home had been exposed to lead in
24 drinking water, would it be important to you to

1 know whether or not that home had a filter that
2 was used for the drinking water?

3 MR. LANCIOTTI: Objection; form and
4 foundation; and beyond the scope of this expert's
5 testimony.

6 A. I think it is beyond the scope of my
7 expertise. I'm not an expert on filters. I do
8 not -- do not know much about water filters.

9 Q. Okay. In your report, Doctor, you focus
10 on five different adverse health incomes [sic],
11 big picture; is that fair to say?

12 MR. LANCIOTTI: Objection to form;
13 foundation.

14 A. I focused on five health outcomes,
15 right.

16 Q. And I'm -- just to summarize, okay, as I
17 read your report, those five are as follows:
18 Number 1, neurobehavioral effects; Number 2,
19 neurological diseases later in life; Number 3,
20 antisocial behavior and aggression in childhood;
21 Number 4, renal disease; and Number 5,
22 hypertension.

23 Did I identify those correctly?

24 A. Yes.

1 Q. Now, for those five adverse health
2 effects, do any of them have other causes apart
3 from lead?

4 MR. LANCIOTTI: Objection; form.

5 Do you want to split that question up,
6 Mr. Ter Molen?

7 MR. TER MOLEN: I'm fine with the
8 question as is. I think we'll be splitting it up
9 here momentarily, but I'm fine leaving it as is
10 for now.

11 BY MR. TER MOLEN:

12 Q. If you understand the question, Doctor.

13 A. I do. I would say yes.

14 Q. Okay. In fact, each of those five has
15 other adverse causes other than -- let me ask that
16 question again.

17 Each of those five adverse health
18 outcomes has causes other than lead, right?

19 MR. LANCIOTTI: Objection; form and
20 foundation.

21 A. Yes.

22 Q. Okay. So let's start with hypertension.
23 Can you identify for us other causes of
24 hypertension?

1 A. Sure. Diet, body weight, body mass
2 index, age.

3 Q. Okay. Very good.

4 And for purposes of the bellwether
5 plaintiffs, you've not done any evaluation of
6 these other factors; is that fair to say?

7 MR. LANCIOTTI: Objection; form;
8 foundation; asked and answered.

9 A. That's fair to say.

10 Q. Thank you.

11 Similarly, for renal disease, Doctor, if
12 you can identify other causes for renal disease,
13 putting lead aside.

14 A. Sure. Hypertension; other environmental
15 exposures; age. I'm not sure about genetics, but
16 I'll stop there.

17 Q. Okay. And, similarly, Doctor, you've
18 not done any evaluation of any bellwether
19 plaintiffs for these other causes, right?

20 MR. LANCIOTTI: Objection; form;
21 foundation; asked and answered.

22 A. That's right.

23 Q. Okay. Let's talk about antisocial
24 behavior and aggression in childhood.

1 You'd agree, Doctor, that there are many
2 potential causes for antisocial behavior and
3 aggression in any particular child?

4 MR. LANCIOTTI: Objection; form.

5 A. Yes, I would.

6 Q. Okay. Can you identify, in your view,
7 the primary causes of antisocial behavior and
8 aggression in childhood?

9 A. I would say it's socioeconomic status;
10 racism, bullying, parenting.

11 Q. Thank you.

12 And, similarly, as for the other two
13 we've talked about, Doctor, you've not done any
14 evaluation of the bellwether plaintiffs for
15 purposes of determining whether these other causes
16 may or may not come into play; is that right?

17 MR. LANCIOTTI: Objection; form;
18 foundation; asked and answered.

19 A. That is right.

20 Q. Let's shift over to the neurological
21 diseases later in life category, Doctor. And I
22 believe you identify three, which are
23 schizophrenia, Parkinson's, and essential tremor;
24 is that right?

1 A. That's fair.

2 Q. It probably makes sense to talk about
3 each of those three individually. Would you
4 agree?

5 A. Sure.

6 Q. Okay. So then for schizophrenia,
7 Doctor, what are the primary causes of
8 schizophrenia, in your view?

9 A. Well, this is something I know a little
10 bit about. There are genetic factors, but there's
11 a significant literature about exposures or
12 dietary deficiencies during pregnancy, during
13 gestation, during fetal life, that predispose one
14 to go on and develop schizophrenia. My -- I
15 mentioned early on, the woman -- the
16 epidemiologist who buttonholed me, as you said,
17 and called me aside, she, Zena Stein, and her
18 husband, Mervyn Susser, did a very, very famous in
19 all of epidemiology landmark study, that so-called
20 Dutch famine study. During World War II, the
21 Dutch were essentially starved by Nazi Germany
22 during a period of eight or 10 months or so. And
23 Susser and Stein, the husband-wife team, studied
24 the children who experienced the famine in fetal

1 life. And they followed them out into adulthood,
2 and lo and behold, the nutritional depravation
3 during -- just during gestation, predisposes those
4 offspring to go on and develop schizophrenia.

5 So it's a very powerful line of
6 investigation about early life exposure and
7 developing very disabling disease later in life.

8 There are also genetic factors. I know
9 Susser and Stein -- as I said, she buttonholed
10 me -- and their son, Ezra Susser, who is my age,
11 actually became chairman of epidemiology when I
12 was chairman of environmental sciences, and so
13 we've exchanged a lot of things.

14 I know there are genetic factors. My
15 daughter, as an aside, adopted a child whose
16 mother is schizophrenic, father not. And so we
17 had many conversations before she adopted that
18 child about what are the risks of this adopted
19 child of going on to develop schizophrenia, which
20 is a spectrum -- there's a spectrum, just like
21 autism. And there's a 1-in-7 chance that a child
22 with one schizophrenic parent could develop
23 some -- something along the spectrum disorder,
24 although if raised outside of the home of

1 schizophrenics, they do much better. So the
2 social environment, you know -- it's interesting.

3 Q. That is interesting.

4 A. So that's -- I just told you -- it so
5 happens my daughter is a psychiatric social worker
6 who deals just with schizophrenics, newly
7 diagnosed schizophrenics, so I get a lot of it at
8 home.

9 Q. Right. Understand. Understand. Okay.
10 Thank you, Doctor.

11 And then, similarly, you've not
12 evaluated any of the bellwether plaintiffs for
13 these other factors with respect to schizophrenia,
14 right?

15 MR. LANCIOTTI: Objection; form;
16 foundation; asked and answered.

17 A. No, I have not.

18 Q. Let's shift over to Parkinson's, Doctor.

19 What are the primary causes of
20 Parkinson's, in your view?

21 A. It's a disease that's not really very
22 well understood, not as much. There are genetic
23 factors. Of course age. The -- you know, I've
24 heard it said by the Parkinson's expert -- excuse

1 me one second.

2 Q. That's fine.

3 A. The neurologist at Columbia, who is the
4 guru for Parkinson's disease at our institution,
5 if you live long enough, you will get it. It's,
6 you know, a deterioration of a certain region of
7 the brain, and if you live long enough, it will
8 happen. So it's a deterioration that accelerates
9 under certain conditions.

10 There are known chemicals that induce
11 syndromes like Parkinson's. Manganese --
12 occupational exposure to manganese, they develop
13 early Parkin- -- what's -- something called
14 "Parkinsonism." It's not exactly the same
15 idiopathic Parkinson's disease, but it's a
16 well-known risk factor.

17 Welders, men who work in welding and use
18 manganese welding rods, are prone to develop a
19 Parkinson-like syndrome. So there are -- there
20 are known chemical exposures that do it, but aging
21 and beyond that.

22 I think I've said all that I want.

23 Q. No, that's fine. I appreciate that.

24 And, similarly, Doctor, you've not

1 evaluated the bellwether plaintiffs for any of
2 these factors; fair to say?

3 A. That's correct.

4 Q. Okay. And then with respect to
5 essential tremor, Doctor, what are the primary
6 causes, in your view, of essential tremor?

7 A. So here again, there are genetics and
8 there is a chemical, a substance called harmine
9 that induces tremor in animals, and we have it in
10 our diets. And my colleague -- here again, the
11 Columbia expert on essential tremor, Elan Louis,
12 has published on exposure to that chemical.

13 There are also genetic risks. I can't
14 tell you in a quantitative way, but if there's a
15 family history, there's a greater likelihood of
16 developing essential tremor.

17 Q. Okay. Similarly, Doctor, for essential
18 tremor, you've not evaluated the bellwether
19 plaintiffs for any of the factors that you
20 identified, right?

21 A. No.

22 MR. LANCIOTTI: Objection; form;
23 foundation; asked and answered.

24 A. No, I have not.

1 Q. All right. And the last category,
2 Doctor, is neurobehavioral effects. And with
3 respect to neurobehavioral effects, Doctor, what
4 are the primary causes, in your view?

5 A. Are we limiting it to intelligence?

6 Q. Well, that's a very good point. Why
7 don't we start first with if you could just define
8 what you mean by neurobehavioral effects and we'll
9 take it from there. Okay?

10 A. Well, neurobehavioral, I guess my child
11 psychologist colleagues would cluster in there
12 intelligence, behavior, conduct disorder. We also
13 study motor function, which is neuro related.

14 Q. Okay. Anything else that you would --
15 as you use the term "neurobehavioral effects,"
16 anything else that you would put in that category?

17 A. Under that category, we have studied
18 classroom performance, classroom behavior.

19 Q. Okay. Anything else?

20 A. Not right now.

21 Q. Fair enough.

22 Doctor, you mentioned conduct disorder,
23 and I want to make sure I understand, because
24 earlier we talked about, as a separate category,

1 antisocial behavior and aggression, right?

2 A. Right. Right.

3 Q. Would conduct disorder fit in that
4 category?

5 A. I guess it would as a subset.

6 Q. Okay.

7 A. If we put it as a subset.

8 Q. That's fine.

9 Okay. Well, I'm going to break that out
10 from the neurobehavioral effects, okay, since we
11 already talked about that category.

12 Is that okay with you if we talk
13 about --

14 A. That's fine.

15 Q. Okay. And then you also mentioned
16 behavior, I think, in general, under the
17 neurobehavioral effects.

18 Would you distinguish behavior from that
19 same category we talked about already, antisocial
20 behavior and aggression?

21 A. Well, I'm not a psychologist, but there
22 are other dimensions of behavior that are outside
23 of antisocial behaviors. So I -- you know, I
24 would say there's more to behavioral issues than

1 just the antisocial behavior.

2 Q. I understand in a purer sense, that the
3 term "behavior" isn't limited to antisocial
4 behavior and aggression, but for purposes of
5 studying the effects of lead on children, would
6 you have a separate category for behavior versus
7 antisocial behavior and aggression, Doctor?

8 A. I would. Here again, I would rely on my
9 colleagues, you know. Our work on lead and this
10 neurobehavior category has always involved
11 significant expertise by research.

12 Gail Wasserman, if you read my CV, you've seen
13 many of the papers. Gail Wasserman is actually
14 the first author on anything having to do with
15 this category of neurobehavior.

16 And I would -- frankly, Mark, I would
17 turn to her and ask her for her opinion here
18 rather than my sit here and --

19 Q. No, that's fine. I understand.

20 I'm really trying to get at what your
21 opinions are, Doctor, so let me come at this
22 another way.

23 Is it fair to say that for your opinions
24 in this case, Doctor, when you talk about

1 neurobehavioral effects as distinct from the other
2 categories that we've talked about, that you're
3 talking about intelligence?

4 A. Yes. That's the prime component that
5 I'd like to talk about, yes.

6 Q. That's fine. Well, why don't we talk
7 about that, then.

8 So focusing on neurobehavioral effects,
9 then, Doctor, with respect to intelligence, which
10 is the focus of your opinions, what other causes,
11 putting lead exposure aside, are there in your
12 view for neurobehavioral effects?

13 A. We're just talking about intelligence
14 now, correct?

15 Q. Yes, we are.

16 A. Yeah. Well, there are -- there are a
17 long list of them, and these are the so-called
18 confounding variables that we consider whenever we
19 do an analysis of the relationship between lead --
20 blood lead and child intelligence.

21 To -- to list them, one is quality of
22 the home-rearing environment. And there is an
23 assessment, it's called Caldwell's HOME. It's an
24 assessment one does. You go into the home and

1 you -- it's a structured interview of -- typically
2 of mom or the primary caretaker, and you interview
3 the caretaker about many aspects of the child's
4 daily life. Do you take the child to -- shopping
5 with you? To what extent does the child have
6 exposure -- normal exposure? How many books does
7 the child have? How many toys does the child
8 have? Is the child's art hanging on the wall?
9 You know, these are indicators -- is there a clock
10 on the wall, believe it or not? These are
11 indicators of sort of the quality of the home
12 environment.

13 Another one is birth order. First-born
14 children do better. Why is that? Well, let me
15 backtrack.

16 So the developing brain in an infant --
17 the developing brain has the most neuronal
18 connections at the age of 1. And then brain
19 actually begins trimming back neuronal
20 connections. And it's -- there's a term for it --
21 I'm blocking on the word -- but in any case, it's
22 pruning. It is literally pruning back. And how
23 does the brain know? Which neuronal connections
24 do you keep and which ones do you discard? Well,

1 you keep the ones that are being used. And so
2 this is one of the reasons why this social-to-home
3 environment, the social stimulation, actually
4 helps kids retain neuronal connections. In the
5 absence of social stimulation, there's a
6 dissipation of that.

7 So birth order plays right into that.
8 Think about -- I don't know -- I have three
9 children. First-born child gets all of the
10 attention. You read to the child, you know. You
11 take a thousand photographs of the child, you
12 know, the first child. You know, the second one
13 gets a little less attention, third one less, and
14 so on. So being born ahead of the rest of the
15 pack is actually beneficial. And so we always
16 control for birth order.

17 Mother's education here again and
18 mother's age play into the ability of the mom to
19 socially engage the child, intellectually engage
20 the child. So it's well known that women of lower
21 education are more likely to have children who do
22 relatively poorly. It makes some logical sense.

23 Mother's age. Very young mom does not
24 do as well in giving a child stimulation and so

1 on.

2 Marital status is a variable that we
3 always take into account. Single mom or dad has
4 much more of a challenge of providing a child with
5 the social stimulation.

6 Prenatal smoking, prenatal alcohol
7 abuse.

8 So these are some of the factors that
9 are known to influence a child's intelligence, and
10 these are the very factors that we statistically
11 adjust for as you, I'm sure, by now well know
12 having read the Lanphear papers and others -- and
13 my own.

14 Q. Yes. Thank you, Doctor. I have a bit
15 of a layman education here.

16 And with the various factors you've
17 described, it's fair to say, Doctor, as we've
18 talked about for the other categories here, is
19 that you've not evaluated any of the bellwether
20 plaintiffs for the existence of these factors,
21 right?

22 MR. LANCIOTTI: Objection; form;
23 foundation; asked and answered.

24 A. No, I have not.

1 Q. And you'd agree, Doctor, that to
2 determine what degree, if any, lead had
3 contributed -- let me start over again.

4 You would agree, Doctor, that to
5 determine whether or not exposure to lead had
6 contributed to an effect on intelligence for any
7 particular individual, that one would need to
8 evaluate and understand all of the different
9 factors you've identified, right?

10 MR. LANCIOTTI: Objection; form;
11 foundation.

12 A. Correct.

13 MR. TER MOLEN: I'd like to introduce a
14 document -- I think we're at Exhibit 6 now --
15 which is from the year 2000, and it's with respect
16 to, I believe, your Yugoslavia work. The primary
17 author, I believe, is a gentleman by the name of
18 Wasserman.

19 A. It's a woman. Gail.

20 Q. Oh, thank you. Appreciate that.

21 - - -

22 (Graziano Exhibit 6 marked.)

23 - - -

24 MR. TER MOLEN: Thank you, Sam.

1 If you could maybe blow -- yeah, thanks.

2 THE WITNESS: Could I just read the
3 abstract for a second just to give me a...

4 Okay.

5 MR. TER MOLEN: Do you mind just
6 scrolling through just quickly, Sam, and we'll --
7 yeah, thank you.

8 THE WITNESS: Could you just go back --
9 just let me look at this. We've published many
10 papers together. I just want to get a sense of
11 which one this is.

12 Can I see the figures, please?

13 And the next figure, please?

14 Okay.

15 BY MR. TER MOLEN:

16 Q. Okay. So, Doctor, you recognize this
17 document that we've marked as Exhibit 6 as a paper
18 that you coauthored, right?

19 A. 20 years ago. Yes.

20 Q. I'm not going to ask you to recite it
21 chapter and verse, Doctor.

22 And this paper relates to the Yugoslavia
23 cohort study that you talked about earlier, right?

24 MR. LANCIOTTI: Objection; form.

1 A. That's correct.

2 Q. Okay.

3 MR. TER MOLEN: Let's go to Page 817, if
4 you don't mind, Sam.

5 Q. Okay. And there is some specific
6 language here that I'm looking at. If we go just
7 above to that paragraph that's just above
8 "Acknowledgments" on the right side.

9 Do you see that?

10 A. Yes.

11 Q. And then -- let me make sure I've got
12 it -- you see the first sentence there, "in
13 summary"?

14 A. Yes.

15 MR. TER MOLEN: We'll come back, Sam, in
16 a second to the other language here.

17 Q. But "In summary, in the present setting,
18 elevations in both prenatal and postnatal blood
19 lead levels are independently associated with
20 small decrements in young children's
21 intelligence."

22 Do you see that?

23 A. Yes.

24 Q. Okay. Bear with me a minute. I just

1 want to find some additional language here.

2 MR. TER MOLEN: Can you scroll down just
3 a little bit.

4 Q. Yeah, the bottom left here -- the
5 paragraph that starts at the bottom left?

6 Do you see that, Doctor? You say "We
7 estimate that relatively high levels of lead are
8 associated with relatively small decrements of
9 IQ."

10 Do you see that?

11 A. Yes, I do.

12 Q. Okay. And do you agree with that today?

13 A. Yes, I do. 20 years ago, this was what
14 we believed.

15 Q. Okay. What --

16 A. Much has happened -- much has happened
17 in the ensuing two decades.

18 Q. And this study was focused on blood lead
19 levels that were -- as I think you can see there
20 later on in the same paragraph, that were above
21 10 micrograms per deciliter, right?

22 MR. LANCIOTTI: Objection; foundation;
23 form.

24 A. Just allow me to read it, please.

1 Well, let me make a comment here. The
2 Yugoslavia study did not, of course, only include
3 children with very high blood leads. It included
4 children with very low blood leads as well in the
5 Pristina city where exposures were very, very low.

6 We used this window of 10 to
7 30 micrograms per deciliter just to illustrate
8 that this is what can happen if blood leads go
9 from 10 -- you know, a child -- child with a blood
10 lead of 30 would have 4.3 IQ points less than a
11 child with a blood lead of 10. Let's just use
12 that as a means of giving the reader some sense of
13 the magnitude of the loss in IQ for children in
14 that range.

15 Since this paper 20 years ago, though,
16 much has been learned, largely as a result of the
17 pooled analysis, which I'm sure we're going to
18 come to, the Lanphear papers, that allow
19 scientists today to make stronger conclusions
20 about blood leads in the low range.

21 Keep in mind, of the seven prospective
22 studies, the Yugoslavia study, because it, you
23 know, involves a smelter population, does have a
24 range of blood leads that is the widest and the

1 highest. That's not to say that we didn't have
2 children in the very low range.

3 But the pooled analysis allows us to
4 reach much stronger inferences and conclusions
5 about the consequences of exposure in the low
6 range.

7 I could go on if you'll allow me.

8 Q. Well, we'll certainly get to the pooled
9 analysis later, Doctor.

10 A. Okay.

11 Q. And believe me, you'll get a chance to
12 discuss the more recent literature. I just want
13 to make sure I understand this study.

14 And I understand what you said, that as
15 you saw blood lead levels increase from
16 10 micrograms per deciliter to 30 micrograms per
17 deciliter, that that increase correlated with an
18 IQ decrement of 4.3 points, right?

19 MR. LANCIOTTI: Objection; form; asked
20 and answered.

21 A. Allow me to clarify one thing here.

22 The tests of intelligence that were used
23 here and in all of the other prospective studies
24 were never tested on a very, very large sample of

1 children in Yugoslavia. It was never totally
2 standardized, you know. How do we standardize an
3 IQ test? We administer it -- here in the
4 United States, you administer to a thousand or
5 10,000, I don't know, children. You devise the
6 distribution, you observe the distribution of
7 scores, and then you assign the average score of
8 an IQ of a hundred. And then the standard
9 deviation is 15, and so the -- that was never done
10 in Yugoslavia. So we relied on U.S. standards
11 to -- which is a leap. We more often refer to
12 actually the test scores rather than IQ.

13 My point is this estimate of IQ is
14 somewhat biased by the fact -- and smaller -- due
15 to the fact that the test was never actually
16 standardized on many, many thousands of children.

17 Q. Okay. Doctor, in this paper, do you
18 note that this result is biased and not
19 standardized?

20 MR. LANCIOTTI: Objection; form.

21 A. I am sure that somewhere in the paper,
22 it says something to that effect, that earlier in
23 the methods, that we're -- that the test has not
24 been -- you know, we're using U.S. standards.

1 Q. I understand.

2 Okay. And understanding that
3 qualification, Doctor, what you conclude in the
4 paper is that an increase in blood lead levels
5 from 10 micrograms per deciliter to 30 micrograms
6 per deciliter resulted in an IQ decrement of
7 4.3 points, right?

8 MR. LANCIOTTI: Objection; form;
9 foundation; asked and answered for the third time.

10 A. That is right. However, let me qualify.
11 Since this time, 20 years ago, we've learned a
12 great deal more about the relationship between
13 blood lead and IQ in the range of zero to 10.

14 Q. I understand.

15 MR. TER MOLEN: Okay. All right. Let's
16 go to the top of the page on the right side here,
17 right?

18 Q. And then you note -- at the top here,
19 Doctor, in the sentence that starts at the end of
20 the second line, top of the page, you note that,
21 "In comparison, social factors, such as those
22 measured here, have considerably stronger
23 associations with child IQ, both in our own and in
24 others' work."

1 A. Absolutely.

2 Q. You absolutely agree with that, right?

3 A. I agree with that.

4 Q. And the intervening literature in the
5 last 20 years has just confirmed that point,
6 correct?

7 MR. LANCIOTTI: Objection; foundation.

8 A. That's correct. If you look at -- we go
9 on to talk about the percent of the variance in
10 IQ. There are other factors that I listed before
11 we got into this conversation that account for
12 more of the variance in IQ than lead.

13 Q. Right.

14 A. Lead is a player, but there are many
15 other players that impact IQ.

16 Q. That's right.

17 And compared to social factors, Doctor,
18 you'd agree that lead is a very minor player,
19 right?

20 MR. LANCIOTTI: Objection; form;
21 foundation.

22 A. That is right.

23 Q. Okay. Doctor, as well as social
24 factors, you agree that there are a number of

1 other chemicals besides lead that can be
2 associated with a decreased or decrement of IQ,
3 right?

4 MR. LANCIOTTI: Objection; foundation.

5 A. Right.

6 Q. Can you identify those for me, please.

7 A. Chemical insults? Oh, my. The list is
8 long.

9 So there are chemicals such as PCBs,
10 polychlorinated biphenyls; there are chemicals
11 such as manganese that I mentioned earlier; there
12 are chemicals such as arsenic; there are chemicals
13 such as plasticizers. I mean, there's a book --
14 well, I -- never mind. I won't go into it.

15 But there are many, many chemicals, just
16 to name a few.

17 Q. Okay. Would you include mercury?

18 A. Yes, I would.

19 Q. Are you familiar with the term
20 organophosphates?

21 A. Absolutely. Organophosphate pesticides.
22 Much work done at my own institution.

23 Q. Okay. You mentioned PCBs.

24 What about, another acronym here,

1 Doctor, PBDEs?

2 A. Those are flame retardants, yes, also.

3 Q. Okay. And it's fair to say, Doctor,
4 that you haven't evaluated any of the bellwether
5 plaintiffs for their exposure to any of these
6 chemicals, correct?

7 MR. LANCIOTTI: Objection; form;
8 foundation; asked and answered.

9 A. Correct.

10 Q. And we'll be talking more about the
11 various studies that you cite in your report and
12 others that relate to low-level lead exposure,
13 Doctor.

14 But sitting here today, are you aware of
15 any epidemiological studies of lead affecting
16 children's IQ that control for exposure to any of
17 these other substances?

18 MR. LANCIOTTI: Objection; form.

19 A. Not for all of them but for some of
20 them.

21 Q. Okay. So sitting here today, you're not
22 aware of any study investigating the association
23 between exposure to lead and loss of IQ in a child
24 that exposes for potential exposure to all of the

1 substances we've described that can also affect
2 IQ; is that right?

3 MR. LANCIOTTI: Objection; form; asked
4 and answered.

5 A. That's right. And, parenthetically,
6 that work is happening now.

7 Q. Who is doing that work, if you know?

8 A. Frederica Perera, who is the former
9 head, the founder of the Columbia Children's
10 Center for Environmental Health. They have
11 followed a birth cohort, births in northern
12 Manhattan and South Bronx for -- they just
13 celebrated their 20th anniversary, the center. So
14 their participants are in their late teens.

15 They have, in fact, measured many, if
16 not all of the list that you just mentioned. And
17 because, as I mentioned earlier, the statistical
18 methodology to study mixtures has now evolved,
19 they're in the thick of it right now doing exactly
20 that work.

21 Q. When do they expect to publish, if you
22 know?

23 A. Oh, it's just in its formative stages.
24 But I know that there are several people working

1 on that full-time, including postdoctoral fellow
2 and a Ph.D. -- brilliant Ph.D. student, and one of
3 our young assistant professors.

4 Q. When you say "just in its formative
5 stages," I take it you mean the publication
6 is years away, if you know?

7 MR. LANCIOTTI: Objection to form.

8 A. Probably years away. They're just
9 assembling this enormous dataset which is being
10 derived from various studies that they've done.
11 So that may sound like an easy task, but it's not.

12 Q. I understand. Thank you. Appreciate
13 it.

14 Doctor, there's a term that I've come to
15 be somewhat familiar with in the context of trying
16 to learn a bit about your work that is -- well,
17 and that term is "nonspecific conditions."

18 Can you define what that term means to
19 you?

20 A. I don't know what the context of your
21 question is.

22 Q. Sure.

23 How about this. If we put it in the
24 context of epidemiology, does that help?

1 A. Not really.

2 Q. Okay.

3 A. Sorry.

4 Q. How about if I put it this way, that I
5 understand the term "nonspecific conditions" to
6 mean conditions for which there are multiple
7 potential causes.

8 MR. LANCIOTTI: Is there a question
9 pending?

10 Q. Would you agree with that definition?

11 MR. LANCIOTTI: Objection; form.

12 A. I'm having a hard time understanding.
13 Forgive me.

14 Q. That's quite all right.

15 Let me put it this way. If -- would you
16 agree, Doctor, that in order to attribute an
17 adverse health outcome in a particular individual
18 to lead exposure, that you would have to perform a
19 differential diagnosis to rule out other potential
20 causes?

21 MR. LANCIOTTI: Objection; foundation.

22 A. I think that's fair. But, as we said,
23 you know, IQ -- loss of IQ, how does one even
24 perform a differential diagnosis because of the

1 large number of variables involved?

2 Q. It becomes certainly very difficult
3 unless you've done a thorough assessment of all of
4 the variables, right?

5 MR. LANCIOTTI: Objection; form.

6 A. That's fair.

7 Q. And with respect to evaluating loss of
8 IQ, you were earlier talking about potential
9 issues with the Yugoslavian study.

10 To evaluate any loss of IQ, isn't it
11 fair to say that you would need a control group,
12 some form of a baseline?

13 MR. LANCIOTTI: Objection; foundation.

14 A. You know, what the epidemiology studies
15 allow one to do, they allow one to say, on
16 average -- on average, a child with a blood lead
17 of this compared to blood lead of that would lose,
18 on average, this number of IQ points.

19 Epidemiology does not allow you to go
20 and talk about an individual child. That's not
21 what it is capable of doing.

22 Q. And as you're saying, Doctor, the
23 epidemiological studies are looking at populations
24 as compared to individuals, right?

1 MR. LANCIOTTI: Objection; form.

2 A. Population of individuals, right.

3 Q. They're at the population level, not the
4 individual level, right?

5 A. Right.

6 Q. And so to fully understand any
7 particular epidemiological study, you'd need to
8 understand what the baseline is for the population
9 level that was being studied, right?

10 A. Right.

11 MR. LANCIOTTI: Objection; form; beyond
12 the scope of this witness's knowledge.

13 Q. And a population-level study done in
14 Manhattan, for example, might have a quite
15 different baseline than the population-level study
16 done of the Bronx; is that fair to say?

17 MR. LANCIOTTI: Objection; form.

18 A. That's fair to say, and that is
19 precisely why the Lanphear pooled analysis coming
20 from many, many different countries and cities
21 within the United States is so important.

22 Q. Right. We will get there. I promise,
23 Doctor.

24 A. Oh, I'm sure.

1 Q. Doctor, I'd like to identify some
2 conditions in addition to those that we've
3 discussed today and then understand your view of
4 any link between these conditions and lead
5 exposure. Okay?

6 A. Sure.

7 Q. So rhinitis. Are you familiar with that
8 term?

9 A. Yes.

10 Q. Is rhinitis, in your view, linked to
11 lead exposure?

12 MR. LANCIOTTI: Objection; form.

13 A. Not to my knowledge.

14 Q. Shortness of breath. Is shortness of
15 breath linked to lead exposure?

16 MR. LANCIOTTI: Objection; form.

17 A. Not to my knowledge.

18 Q. Skin rashes. Are skin rashes linked, in
19 your view, to lead exposure?

20 MR. LANCIOTTI: Objection; form.

21 A. No.

22 Q. Hair loss. Is hair loss linked, in your
23 view, to lead exposure?

24 MR. LANCIOTTI: Objection; form.

1 A. Not that I know of.

2 Q. Nerve pain. Is nerve pain linked, in
3 your view, to lead exposure?

4 MR. LANCIOTTI: Objection; form.

5 A. So adults with occupational lead
6 poisoning can experience nerve pain.

7 Q. Okay.

8 A. I don't know of any such literature in
9 children.

10 Q. Thank you. Sorry to cut you off,
11 Doctor.

12 By "occupational exposure," I take it
13 that you mean -- we're talking about blood lead
14 levels in excess of, say, 15 micrograms per
15 deciliter?

16 MR. LANCIOTTI: Objection; form;
17 foundation.

18 A. Yes.

19 Q. Exhaustion. Is exhaustion, in your
20 view, linked to lead exposure?

21 MR. LANCIOTTI: Objection; form.

22 A. Well, fatigue. I don't know I would use
23 the word "exhaustion," but fatigue, yes.

24 Q. All right. And at what levels of lead

1 exposure, in your view, is fatigue linked to lead
2 exposure?

3 MR. LANCIOTTI: Objection; form.

4 A. Greater than 30.

5 Q. And that by "30," you mean 30 micrograms
6 per deciliter?

7 A. 30 micrograms per deciliter, yes.

8 Q. What about memory loss? Is memory loss
9 associated with lead exposure?

10 MR. LANCIOTTI: Objection; form.

11 A. Well, it certainly is, again, at high
12 blood lead levels.

13 Q. Okay. Again, above 30 micrograms per
14 deciliter?

15 A. Yes.

16 Q. What about blackouts? In your view,
17 Doctor, do people experience blackouts in
18 association with lead exposure?

19 MR. LANCIOTTI: Objection; form.

20 A. Yes, but only when the blood lead is
21 exceedingly high.

22 Q. Okay. With respect to depression,
23 Doctor, is depression a condition that, in your
24 view, is linked to lead exposure?

1 MR. LANCIOTTI: Objection; form.

2 A. Not that I know of.

3 Q. Okay. Chronic anxiety, Doctor? Is
4 chronic anxiety, in your view, linked to lead
5 exposure?

6 MR. LANCIOTTI: Objection; form.

7 A. Not that I know of.

8 Q. Post-traumatic stress disorder. Doctor,
9 is that a condition that, in your view, is linked
10 to lead exposure?

11 MR. LANCIOTTI: Objection to form.

12 A. No.

13 Q. Forgetfulness, Doctor. Is that a
14 condition that is linked, in your view, to lead
15 exposure?

16 MR. LANCIOTTI: Objection to form.

17 A. Well, memory is a component of some of
18 the assessments we have done. Yes, I would say
19 short-term memory is one of the outcomes that has
20 been investigated with regard to lead.

21 Q. Certainly in the context of, for
22 example, Parkinson's, short-term memory can be an
23 issue. Outside of a condition like that, Doctor,
24 in your view, is there a link between short-term

1 memory issues and lead exposure?

2 MR. LANCIOTTI: Objection; form.

3 A. I'm trying to recall work from 20 years
4 ago, and it's not easy.

5 I'm going to be -- I'm going to
6 equivocate on this one, if you don't mind.

7 Q. That's fine. That's fine.

8 And the work that you're trying to
9 recall, Doctor, understanding that you're trying
10 to recall it, was that focused on adults as
11 opposed to children?

12 A. Children.

13 Q. On children. Okay.

14 So sitting here today, it's fair to say
15 you're just not sure; is that fair?

16 A. That's fair.

17 Q. Okay. With respect to Alzheimer's,
18 Doctor, is there a link, in your view, between
19 Alzheimer's and lead exposure?

20 A. No.

21 MR. LANCIOTTI: Objection; form.

22 Q. I'd like to talk about the methodology
23 that you used in putting together your report in
24 this case that we've marked as Exhibit 3. Okay?

1 A. Yes, sir.

2 Q. On Page 3 of your report -- and, again,
3 I'm happy to show it to you -- you talk about
4 providing a, quote, unquote, brief review of the
5 scientific literature that points to, and you use
6 the phrase, causal and/or suggestive links between
7 lead exposure and adverse health outcomes in
8 children. Okay?

9 A. Yes, sir.

10 Q. And what do you mean by the term "brief
11 review"?

12 A. Well, I had the good fortune in this
13 case to have been armed with fairly massive
14 systemic reviews of the literature done both by --
15 in particular, by ATSDR and by -- and somewhat
16 earlier than that, by EPA. And this panel of
17 scientists, experts, one of whom, for example --
18 you mentioned Wasserman, Gail Wasserman. My
19 colleague was one of the many scientists involved
20 in these reviews. But they had undergone --
21 because lead is covered under the Clean Air Act,
22 it's one of the priority pollutants under the
23 Clean Air Act.

24 It is regular -- on regular intervals,

1 the literature is reviewed to see whether, for
2 example, the EPA criteria for lead in air is
3 sufficiently protective of the public.

4 So it had these government agencies do
5 these massive reviews just recently, and what's --
6 so I took advantage of that. I could have set
7 about and done my own systematic review of the
8 literature, which would have taken a year and a
9 half to do it adequately. It took these
10 committees that much time, or longer, to actually
11 achieve what they did. And so I -- by saying
12 whatever the words were briefly, I tried to
13 reflect the incredible amount of work that went
14 into these systematic reviews of literature rather
15 than reinvent the wheel, and I couldn't possibly
16 reinvent the wheel as well as they had done.

17 Is that clear?

18 Q. Okay. That's fair enough, Doctor. I
19 appreciate that.

20 Then on Page 11 of your report -- and
21 shifting gears from a general discussion of the
22 lead-related scientific literature to a more
23 specific focus of the scientific literature
24 related to low-level lead exposure, okay, you say

1 there in that first paragraph under 4 -- let's
2 see -- six lines up from the bottom of that first
3 paragraph, you say "I", meaning you, "believe that
4 I have provided a fair representation of the
5 scientific literature concerning, for the most
6 part, low-level lead exposure in the range that
7 has been experienced by the children of Flint,"
8 right?

9 A. Right.

10 Q. Okay. And what do you mean by the term
11 "fair representation" as you use it in that
12 sentence?

13 A. I haven't cherry-picked. I haven't
14 ignored, you know, opinions that -- well, just
15 that. I haven't cherry-picked.

16 Q. Okay.

17 A. And, you know, I must say that the ATSDR
18 and EPA massive reviews did consider all of the
19 literature, whether it was reaching -- with the --
20 let me -- I'm sorry.

21 They did consider all of the literature.
22 They, too, didn't cherry-pick just the studies
23 that they felt would lead to the conclusions that
24 they reached.

1 Q. Okay. Are there studies that reached
2 different conclusions from your report as to
3 whether low-level lead exposures caused the health
4 effects discussed in your report?

5 A. I think there are studies that reach
6 different dose-response relationships. I don't
7 know of any study in the past 20 years that is
8 credibly peer reviewed that says there's no effect
9 of lead on child intelligence. They may argue
10 about methodology and did you control for this or
11 did you control for that. But I don't know --
12 that's not the case.

13 Going back in time before the
14 prospective studies, surely there were small
15 studies, case control studies, cross-sectional
16 studies that might have reached the conclusion
17 that there is no association between blood lead
18 and child intelligence. That's before the era of
19 doing the modern longitudinal epi studies that
20 have been done.

21 Q. Okay. I understand, Doctor.

22 And it's a -- it is a broad area, but
23 just to try to zero in on a specific area that I
24 think is of interest to both of us, let's talk

1 about studies that are looking at effects on
2 intelligence in children of blood lead levels less
3 than 5 micrograms per deciliter. Okay?

4 A. Okay.

5 Q. Okay. Sitting here today, are you aware
6 of any studies that have not found an association
7 between blood lead levels less than 5 micrograms
8 per deciliter and children's intelligence?

9 A. I am not.

10 Q. Okay. And you've identified the two
11 extensive studies that you've relied on as having
12 done a systematic review of the scientific
13 literature with respect to lead exposure and
14 health effects, right?

15 A. That's correct. Particularly the ATSDR
16 report of just recent, 2019.

17 Q. Okay. And do you know what methods the
18 ATSDR committee used to reach their conclusions?

19 A. Well, they do spell out in considerable
20 detail the criteria they used for reaching
21 causal -- conclusions of causality. And I can't
22 reiterate them off the top of my head, but there
23 is a section of the document devoted to their
24 causal inference, referring undoubtedly to the

1 Bradford Hill criteria.

2 Q. Okay. And just so we're clear, Doctor,
3 picking up on the terms that you just used there,
4 and I think you've got this terminology on Page 4
5 of your report, where you use the phrase "casual
6 and/or suggestive links."

7 Do you recall using that phrase?

8 A. Oh, definitely. And I went through the
9 five health outcomes that you enumerated early on.
10 And by no means do I conclude that all of them
11 reach the Bradford Hill criteria for causality,
12 and I specifically mention that in my summary.

13 Q. You certainly do, yeah.

14 Can you explain, in your view, the
15 difference between a causal link versus a
16 suggestive link?

17 A. Sure. The literature -- for those
18 outcomes where I think it's suggestive, is
19 considerable but has not reached the -- sufficient
20 number of the Bradford Hill criteria for us to
21 come down and, you know, put the hammer down and
22 say "This is causally related." I would have been
23 derelict, I think, if I didn't mention health
24 outcomes outside of child intelligence because it

1 is conceivable, given the state of knowledge, that
2 they could arise -- they could -- as time evolves,
3 they could be a consequence of early lead
4 exposure.

5 So I felt I was being fair in bringing
6 them before counsel.

7 Q. I appreciate that.

8 And just to, again, put it in my own
9 words, Doctor, the -- in your view, science has
10 established a causal link between lead exposure
11 and effects on intelligence in children, right?

12 A. Right.

13 Q. Okay. And putting aside effects on
14 intelligence, in your view, in its current state,
15 the scientific literature has not established a
16 causal link between lead exposure and any other
17 adverse health effects in children, right?

18 MR. LANCIOTTI: Objection; form;
19 foundation.

20 A. As of today, that is right, although I
21 think the evidence moving forward about behavior
22 is considerable. But as of today, I don't -- I
23 don't disagree with that.

24 Q. I understand. Appreciate that.

1 There have several places in your
2 report, Doctor -- and I'm happy to show you
3 specific pages if that's helpful -- where you
4 refer to the -- or where you use the phrase
5 "weight of the evidence."

6 Do you recall using that phrase?

7 A. I do.

8 Q. Can you explain what you mean by that
9 phrase?

10 A. So it comes down, again, to the
11 Bradford Hill criteria. So Bradford Hill talked
12 about a number of criteria that are required. If
13 one looks at the literature, if one looks at the
14 weight of the evidence, you want to see certain
15 parameters validated. What is the consistency of
16 the observation across many studies? What's the
17 temporality? Did the exposure occur before the
18 outcome? Is there a biological gradient, a
19 dose-response relationship? Is there biological
20 plausibility? Is there experimental evidence in
21 nonhuman species?

22 So this is what I refer to as the weight
23 of the evidence. And, of course, the weight of
24 the evidence when it comes to the literature in

1 experimental animals is very, very large with
2 regard to the very five health outcomes -- except
3 for criminal behavior -- I don't think we have
4 criminal behavior among rats -- but the weight of
5 the evidence on the biological side, biological
6 plausibility, the mechanism of action, all of
7 these play into what I call the weight of the
8 evidence.

9 Q. Okay. And that's a phrase that you're
10 using when you're looking at literature that's
11 relating to evaluating potential associations
12 between lead exposures and health outcomes other
13 than on effect on intelligence, right?

14 A. Right.

15 Q. Okay. We've talked about the
16 Bradford Hill criteria, Doctor. And my
17 understanding, there are nine different criteria.

18 Does that sound correct to you?

19 A. And here they are (indicating).

20 Q. Okay. Very good. It looked like you
21 were referring to some notes earlier.

22 Do you want to just list them out for
23 us, Doctor?

24 A. Say again?

1 Q. Do you mind just listing them out for
2 us.

3 A. Sure.

4 Strength of the association; consistency
5 of the findings; specificity of the findings;
6 temporality; biological gradient; coherence;
7 biological plausibility; experimental evidence;
8 and analogy.

9 Q. Did you yourself apply those criteria
10 when you were evaluating in your opinion the
11 literature with respect to use the term "low-level
12 lead exposure" and effects on intelligence?

13 A. Yes, I did.

14 Q. Okay. You don't do that specifically in
15 your report, right?

16 A. I did not enumerate them one by one, no.

17 But bear in mind, I've lived this
18 literature. I've lived through it personally by
19 doing investigations, annual meetings of Society
20 of Toxicology and so on.

21 And so I have seen this evolve over time
22 going back to the days when there was deny, deny,
23 deny by the lead industry experts and the gasoline
24 industry experts. Deny, deny, deny.

1 Q. Appreciate that.

2 MR. TER MOLEN: You know, we're at a --
3 from my standpoint -- I'm happy to keep going, but
4 we're also at a good stopping point for me, and I
5 know East Coast time it's about 12:15.

6 Should we take a break now for lunch?
7 Does that work for people?

8 THE WITNESS: Certainly works for me.

9 MR. TER MOLEN: Okay. Why don't we plan
10 to take, let's say, 45 minutes, and we'll come
11 back at the top of the hour then. Okay?

12 VIDEOGRAPHER: The time is 12:15 p.m.,
13 and we're off the record.

14 - - -

15 Thereupon, the luncheon recess
16 was taken at 12:15 p.m.

17 - - -

18

19

20

21

22

23

24

1 OCTOBER 29, 2020

2 THURSDAY AFTERNOON SESSION

3 1:00 P.M.

4 - - -

5 VIDEOGRAPHER: The time is 1:00 p.m.,
6 and we're on the record.

7 BY MR. TER MOLEN:

8 Q. Doctor, I'd like to look briefly at a
9 couple of studies that relate to the discussion
10 that we had on low-level lead. The first I'm
11 going to show you is a study published in 2017
12 with Taylor as the lead author.

13 MR. TER MOLEN: So, Sam, if you're able
14 to put that one up. Thank you.

15 We'll mark this as Exhibit 7, I think.

16 - - -

17 (Graziano Exhibit 7 marked.)

18 - - -

19 BY MR. TER MOLEN:

20 Q. Doctor, this document that we've marked
21 as Exhibit 7 is, as I said, published in the
22 journal, NeuroToxicology.

23 Are you familiar with that journal?

24 A. I am. It's not something I read

1 regularly, but yes.

2 Q. It's a reputable journal?

3 A. Yes, it is.

4 Q. And the title of this is "Effects of
5 Low-Level Prenatal Lead Exposure on Child IQ at
6 4 and 8 years in a UK Birth Cohort Study," right?

7 A. Yep.

8 Q. And the lead author is a Ms. Caroline
9 Taylor, right?

10 A. Yes.

11 Q. Are you familiar with her?

12 A. No.

13 Q. Are you familiar with any of the authors
14 identified in Exhibit --

15 A. No, I am not.

16 Q. -- 7?

17 Okay. Is this a study that you looked
18 at for purposes of your opinion, Doctor?

19 A. No, it is not.

20 Q. And can you tell me why that is since
21 this is looking at low-level prenatal lead
22 exposure and that's a topic on which your opinion
23 touches?

24 A. I -- I cannot. I missed it.

1 Q. Okay. You would have liked to have
2 reviewed this and included this in your opinion,
3 right?

4 MR. LANCIOTTI: Objection; form and
5 foundation.

6 A. Yes. I -- I would have to go back to
7 the ATSDR document, which was a 2019 publication,
8 and see whether -- how they consider this, but...

9 MR. LANCIOTTI: Dr. Graziano, if you
10 need to review this article before answering any
11 questions, please take the time you need.

12 THE WITNESS: Oh. I would not mind that
13 at all. May I have that ability?

14 MR. TER MOLEN: Sure. Take your time,
15 Doctor. We can scroll through.

16 Sam, do you mind just kind of scrolling
17 through quickly to the end so we get a sense of
18 the overall length.

19 And then we can work through this at
20 your leisure, Doctor.

21 THE WITNESS: Well, given the length,
22 I'm not going to be able to digest this quickly.

23 BY MR. TER MOLEN:

24 Q. Okay. I understand.

1 If we can turn to Page 167 of this,
2 please. Thank you.

3 And then they break down the scoring
4 into boys and girls, right?

5 A. Right.

6 Q. And then would it surprise you, Doctor,
7 that this study actually finds an inverse
8 relationship between the exposure to lead on the
9 one hand and IQ on the other amongst girls?

10 MR. LANCIOTTI: Objection; form;
11 foundation.

12 A. Yes. That runs counter to everything
13 that's been seen in other literature.

14 Q. Sure. It does, indeed.

15 But, again, we're talking very low
16 levels here.

17 Okay. I understand you haven't had a
18 chance to look at this.

19 We'll put up another document -- another
20 study that we'll mark as Exhibit 8.

21 (Graziano Exhibit 8 marked.)

22

23 BY MR. TER MOLEN:

24 Q. This is a 2018 study. The lead

1 author -- and I may massacre this -- is
2 Desrochers-Couture.

3 Do you see that?

4 A. I do.

5 Q. Okay. Are you familiar with the lead
6 author?

7 A. No, I'm not.

8 Q. Okay. Are you familiar with any of the
9 authors?

10 A. Bruce Lanphear.

11 Q. Indeed.

12 MR. TER MOLEN: If you can scroll up,
13 Sam. A little bit higher. Thank you.

14 Q. This is a publication called Environment
15 International, correct?

16 A. Yes.

17 Q. Are you familiar with that publication?

18 A. Yes.

19 Q. Is it a reputable publication?

20 A. Yes. It's okay.

21 Q. And this is titled "Prenatal,
22 Concurrent, and Sex-Specific Associations Between
23 Blood Lead Concentrations and IQ in Preschool
24 Canadian Children," right?

1 A. Yes.

2 Q. Have you seen this article before today?

3 A. No.

4 Q. Okay. Obviously, this is quite recent
5 research looking at the association between blood
6 lead levels and children, correct?

7 A. That's correct.

8 Q. Okay. And is this something that you
9 wish you had looked at for purposes of your
10 opinion in this case?

11 MR. LANCIOTTI: Objection; form;
12 foundation. He just testified that he hasn't
13 reviewed this article. He hasn't seen it yet.

14 You can answer.

15 A. Yes.

16 Q. Okay. And sitting here today, do you
17 know why it is that you haven't seen this article?

18 MR. LANCIOTTI: Objection; form;
19 foundation.

20 A. As I said, I did not do an extensive
21 systematic review of the literature. I relied on
22 the ATSDR systematic review of the literature
23 which was published in 2019. And here again, I'm
24 surprised that they didn't pick it up either.

1 Q. Okay. And do you see what the objective
2 is? The objective here, looking under the
3 "Abstract," is to test the associations between
4 blood lead concentrations and cognitive function
5 in Canadian preschoolers.

6 Do you see that?

7 A. Yes.

8 Q. Okay. And that objective, obviously, is
9 directly relevant to your opinions, correct?

10 MR. LANCIOTTI: Objection; form;
11 foundation.

12 A. Yes.

13 Q. And then if you go down under "Results"
14 there, do you see that? It says "Median blood
15 lead concentrations for the mother at first
16 trimester and third trimester of pregnancy and for
17 cord and child blood were 0.6 micrograms per
18 deciliter, 0.58 micrograms per deciliter,
19 0.79 micrograms per deciliter, and 0.67 micrograms
20 per deciliter, respectively. We found no
21 association between cord blood concentrations and
22 intelligence scores in multivariable analysis."

23 Did I read that correctly?

24 A. Yes.

1 And I just would add that these are
2 astonishingly low blood lead concentrations
3 bordering on the limit of detection of the method.
4 These are all less than 1.

5 Q. Yes.

6 A. Not only less than 5, but they are less
7 than 1.

8 Q. Right.

9 Okay. And, Doctor, is it fair to say
10 that based on all of your experience and years of
11 study, that if a blood lead level is less than 1,
12 you would not expect to have any effect on
13 intelligence?

14 MR. LANCIOTTI: Objection; form;
15 foundation.

16 A. I'm not surprised that a blood lead less
17 than 1 has no effect on intelligence, you know.
18 These do not -- these do not really reflect
19 anthropomorphic sources of lead, you know. If you
20 look at populations who live in the mountains of
21 Nepal where the only -- you know, the only
22 exposure they get is from volcanic eruptions,
23 these are the kinds of blood lead levels that one
24 sees.

1 So this -- these blood levels do -- are
2 just -- are astonishingly low.

3 Q. Okay. I appreciate that.

4 And, again, just to go back to my
5 question, I just want to make sure I understand
6 what your answer was.

7 You would expect that blood lead levels
8 between 1 microgram per deciliter do not indicate
9 an effect on intelligence in children, right?

10 A. I'm not --

11 MR. LANCIOTTI: Objection; form; asked
12 and answered.

13 A. I'm not at all surprised. I don't know
14 what you use as your control comparison. Is it
15 children who have negative numbers?

16 Q. I understand. Understand.

17 Okay. And if the same results had come
18 back, Doctor, when you read the last sentence
19 there under "Results," it says "No associations
20 were found between intelligence scores and
21 prenatal maternal blood or concurrent child blood
22 lead concentrations," right?

23 A. Right.

24 Q. And if the blood lead levels had been

1 2 micrograms per deciliter or lower, you would not
2 have been surprised at the exact same finding of
3 no association, right?

4 A. I would not --

5 MR. LANCIOTTI: Objection to form. He's
6 not the author of this study.

7 A. I would not say that, Mark.

8 Q. You would not say that. Okay.
9 What would you say?

10 A. I would say that there is -- I know
11 we'll come to it -- the pooled analysis which
12 looks at a very large number of children in the
13 low blood lead range, below 5, and we see a
14 striking dose-response relationship. These blood
15 leads are far below, I would dare say, any that
16 were observed in the pooled analysis, so...

17 Q. Okay. And, you know, there's a -- would
18 you expect, Doctor, that there is some threshold
19 of blood lead level before there is an adverse
20 effect on child intelligence?

21 MR. LANCIOTTI: Object to form.

22 A. We have not ever seen any. The EPA has
23 concluded that there is no threshold; there is no
24 safe level of lead.

1 Q. Well, it's fair to say, Doctor, I think
2 you're maybe stating it a little differently than
3 what the language is, right? I mean, the language
4 is there has not been a safe level that's been
5 identified, right?

6 A. That's correct.

7 Q. Okay. And looking at these results
8 here, your reaction to these results indicates
9 that you're not surprised that there has been no
10 observed effect at the blood lead levels less than
11 1 microgram per deciliter reflected here, right?

12 MR. LANCIOTTI: Object to form.

13 A. I would want to see this replicated in
14 this extraordinarily low range. You know, we
15 talked about Bradford Hill criteria and
16 consistency of the findings. This is not
17 consistent with other work that admittedly has not
18 gone down below 1 microgram per deciliter.

19 Q. Okay.

20 A. My laboratory does not even report blood
21 leads less than 1 --

22 Q. Okay.

23 A. -- because of the -- again, you're
24 approaching on the level of detection of the

1 instrumentation.

2 Q. Okay. Understand.

3 So your point, I think, Doctor, is there
4 may well be a threshold below which neurological
5 effects in children do not occur, right?

6 MR. LANCIOTTI: Object to form.

7 A. I wouldn't reach that conclusion, Mark,
8 based on this one paper. Again, it's a relatively
9 small sample size; 600 children. They use -- they
10 used an assessment tool that is not one that was
11 used in all of the longitudinal perspective
12 studies. They used this -- it's not the WISC.
13 They use a different test of intelligence. This
14 is referred to as the WPPSI, which can be used in
15 very young children.

16 The younger you go in assessing
17 intelligence, the more imprecise the measure is.
18 As you might imagine, testing 5-year-olds and
19 7-year-olds, you can get a better handle on what a
20 child is capable of doing than testing a
21 3-year-old or a 4-year-old.

22 Q. Sure. Sure.

23 It is very difficult, and as you said,
24 it's very imprecise to try to measure IQ at these

1 early ages, right?

2 MR. LANCIOTTI: Object to form;
3 foundation.

4 A. Right.

5 Q. Okay. And a minute ago, you mentioned
6 the sample size, Doctor, and you mentioned that
7 the sample size here was approximately 600; is
8 that right?

9 A. That's right.

10 Q. And as a general matter, you'd agree
11 that the larger the sample size, the more reliable
12 the study, correct?

13 MR. LANCIOTTI: Object to form.

14 A. Well, the more statistically powerful.
15 It doesn't mean it's more reliable. There are a
16 lot of things that go into the word "reliable."

17 Q. Okay. Fair point.

18 The more statistically powerful -- the
19 more statistically -- the larger the sample size,
20 the more statistically powerful the study is,
21 right?

22 MR. LANCIOTTI: Object to form.

23 A. That's right. And I said, the younger
24 the child, the less precise is the measurement of

1 the outcome.

2 Q. Sure.

3 And where does that kick in? Is it a
4 sliding scale, Doctor, as far as the age of the
5 child and the intelligence testing? I get your
6 sense that looking at this study, which was
7 focusing on 3 and -- is it 3- and 4-year-olds --
8 yes -- that that's a very young age and we should
9 look skeptically at the IQ measurements as being
10 very imprecise; is that fair?

11 MR. LANCIOTTI: Object to form.

12 A. The -- you know, the ability to -- just
13 let me look at this one more second.

14 Yeah, I mean, here again, I'm not the
15 developmental psychologist. My colleague,
16 Gail Wasserman, is the one. And I would -- in a
17 room -- if we were all in the room, I would turn
18 to her and ask her the very question that you
19 asked me. But it's -- it's -- I have no doubt
20 that as one goes into older ages, the ability to
21 assess a child's intelligence gets better and
22 better.

23 Q. Sure. Okay. It's very imprecise at the
24 younger ages, and then it becomes more precise the

1 older the child becomes, right?

2 A. Right.

3 MR. LANCIOTTI: Object to form.

4 A. And being imprecise adds -- tends to
5 bias to the null -- to the null finding. If the
6 measurement of the outcome is imprecise, you can
7 have all of the statistical power you want. It
8 still is a bias to the null.

9 Q. Understand.

10 And going back to one of your earlier
11 answers, Doctor, I appreciate that you'd like to
12 see this -- the findings of this study confirmed,
13 right?

14 A. Yes, indeed.

15 Q. Okay. And if the findings of this study
16 are confirmed, then it may be that they indicate
17 that, in fact, there is a threshold below which
18 exposure to lead does not have an adverse effect
19 on children's neurological function, right?

20 MR. LANCIOTTI: Object to form;
21 foundation.

22 A. Possibly.

23 Q. Okay.

24 A. Possibly below 1 --

1 Q. Okay. And sitting here today --

2 A. -- microgram per deciliter.

3 Q. I'm sorry. Okay. Have you finished?

4 A. Possibly below 1 microgram per
5 deciliter.

6 Q. Okay. And sitting here today, we don't
7 know if there's a threshold or not; is that fair
8 to say? Is that your view?

9 MR. LANCIOTTI: Object to form; asked
10 and answered.

11 A. The findings from the pooled analysis,
12 which is the results of seven longitudinal studies
13 from fetal life through age 10 and beyond,
14 indicate that there is no threshold.

15 Q. Well, you just said I think a minute
16 ago, Doctor, that none of those studies were
17 looking at these very low blood lead levels below
18 1 microgram per deciliter, right?

19 A. Agreed. Not below 1, agreed.

20 Q. And so, again, there may well be a
21 threshold at 1 microgram per deciliter, right?

22 MR. LANCIOTTI: Object to form; asked
23 and answered.

24 A. It's conceivable.

1 Q. Okay. Sitting here today, you don't
2 know; fair to say?

3 A. Well, I know that the findings from the
4 pooled analysis, I know what they say. This --
5 looking at this stand-alone paper that has
6 remarkably children with blood leads less than 1,
7 I don't know where you would -- where else you
8 would find such children. But it's -- based on
9 this study standing alone, they would imply that
10 there's a threshold below 1.

11 Q. Okay. Let's shift to -- back to --
12 well, your report, Doctor, on Page 11 and a couple
13 other locations, you used the phrase "undue
14 exposure." And to put it in context, you talk
15 about undue exposure as the type that occurred in
16 association with consumption of water from the
17 Flint River.

18 Do you recall that phrase?

19 A. I do.

20 Q. Okay. And what do you mean by "undue
21 exposure"?

22 A. Essentially that's a term that was used
23 by -- in a report by the CDC back in 1985, the
24 consequences of undue exposure to lead. I believe

1 it was '85. And it really means any lead exposure
2 that's from anthropomorphic sources, from manmade
3 sources.

4 Q. Okay.

5 A. There are natural sources. As I said,
6 volcanos. You have -- you have lead in the air
7 due to natural events. Undue exposure is anything
8 incremental above that.

9 Q. Got it.

10 Okay. And so undue would include
11 exposure to lead paint?

12 A. Yes.

13 Q. It would include exposure to lead dust?

14 A. Yes.

15 Q. It would include exposure to lead in the
16 soil?

17 A. Yes.

18 Q. And it would include exposure to any
19 lead that was in the water?

20 A. Yes.

21 Q. Okay. All right. And so as you use
22 this phrase, again, as you just answered, you are
23 not referring just to lead in drinking water; fair
24 to say?

1 MR. LANCIOTTI: Object to form.

2 A. Well, in the context of my report on the
3 Flint water lead problem, I was, indeed, referring
4 to this undue exposure from lead in drinking water
5 in Flint, which I don't think anyone disputes that
6 that did occur.

7 MR. TER MOLEN: Okay. Why don't we --
8 just to make sure there's no confusion, Sam, if
9 you don't mind putting up Page 11 from
10 Dr. Graziano's report, Exhibit 3.

11 Okay. Yeah, thank you there. If we
12 could go to the second paragraph under 4. And,
13 let's see -- and then it's about halfway down.
14 It's the fifth line down.

15 BY MR. TER MOLEN:

16 Q. "Countless studies of dose-response
17 relationships lead to the conclusion there is no
18 safe level of lead." And you say that "And any
19 undue exposure as the type that occurred in
20 association with consumption of water from the
21 Flint River."

22 Okay? And so in this context in your
23 report, you are talking about exposure to lead in
24 drinking water, right?

1 A. That is correct.

2 Q. Okay. And you agree, Doctor, that
3 before the switch in water sources made by the
4 City in April of 2014, that there was lead in some
5 drinking water in homes in Flint, right?

6 MR. LANCIOTTI: Object to form;
7 foundation; beyond the scope of this expert's
8 testimony.

9 A. Well, given that it's my understanding
10 that lead pipes were mandated in the 19th century,
11 I would say it's safe to assume that there was
12 some lead in drinking water, yes.

13 Q. Okay. And based on the studies you've
14 seen, Doctor, you agree that there were some
15 children in Flint who had blood lead levels
16 greater than 5 micrograms per deciliter before the
17 switch in water sources was made in April of 2014?

18 MR. LANCIOTTI: Objection; form;
19 foundation.

20 A. Yes, I'm aware of that.

21 Q. Okay. And you agree that their
22 exposures to lead were, as you used the term,
23 "undue"; is that right?

24 A. Yes.

1 MR. LANCIOTTI: Objection; form;
2 foundation.

3 Q. Okay.

4 MR. LANCIOTTI: I'm sorry. Was there an
5 answer?

6 THE WITNESS: Yes.

7 Q. And sitting here today, Doctor, is it
8 fair to say that you do not have an understanding
9 of what the average level of lead was in drinking
10 water in Flint before the switch in water sources?

11 MR. LANCIOTTI: Objection; form; beyond
12 the scope of this expert's testimony.

13 A. That is correct. I do not know.

14 MR. TER MOLEN: If we can go to Page 3
15 of your report.

16 Q. I just would like to make sure I'm
17 understanding what you're saying here, Doctor.
18 You -- in the second paragraph there, you talk
19 about a sequence of poor engineering and policy
20 decisions. I think we talked earlier that in this
21 paragraph and the previous paragraph, you're
22 giving a historical perspective, but you're
23 basically repeating what you read from others,
24 right?

1 A. That is correct.

2 Q. Okay. And when you talk here about
3 citizens -- let me start over.

4 When you talk here about residents of
5 Flint being exposed to lead in their water as a
6 result of the switch, again, you don't know what
7 levels of lead in the water were involved; is that
8 fair to say?

9 MR. LANCIOTTI: Objection; form;
10 foundation.

11 A. I only know about the report by
12 Marc Edwards' group. That's what I know.

13 Q. And that's a report that you cite in
14 your paper where he found that about 20 percent of
15 the 120 homes that he evaluated exceeded EPA MCL?

16 A. That's correct.

17 MR. TER MOLEN: We'll put up another
18 document here we'll mark as Exhibit 9, I think.
19 And this is a summary of information of blood lead
20 levels in Flint that comes from the CDC, I
21 believe.

22 Oh, thanks, Sam. I'm not sure that's
23 the one we're looking for. This is the one that's
24 by Kennedy. I think it's a different document

1 than this. But if we need to come back, let me
2 know. This is not a new one.

3 Great. Thank you very much.

4 - - -

5 (Graziano Exhibit 9 marked.)

6 - - -

7 BY MR. TER MOLEN:

8 Q. You're familiar, obviously, with the
9 CDC, Doctor, right?

10 A. Yes, I am, certainly.

11 Q. And are you familiar with this
12 publication, the MMWR?

13 A. Yes, I am.

14 Q. Okay.

15 MR. TER MOLEN: And if we could scroll
16 down to Page 4 of this document, please, Sam.
17 Thank you.

18 Q. And this is -- and Table 1 is showing
19 blood lead level tests of children in Flint; is
20 that right?

21 A. Yes. I have seen this document.

22 Q. Okay. Good. You've seen that.

23 And so before the switch, this document
24 shows that approximately 3.1 percent of the

1 children in Flint had blood lead levels of 5 or
2 more -- 5 micrograms per deciliter or more; is
3 that right?

4 A. That's right.

5 Q. Okay. And you agree that those -- that
6 3.1 percent of children were -- they were exposed
7 to excess lead levels, right?

8 A. That's right.

9 MR. LANCIOTTI: Object to form.

10 A. Yes, that's right.

11 Q. And then immediately after the switch in
12 water sources in April, the percentage of children
13 with blood lead levels greater than 5 micrograms
14 per deciliter rose to 5 percent, right?

15 A. That's correct.

16 Q. And that means that 95 percent of the
17 children in Flint then had blood lead levels below
18 5 micrograms per deciliter, right?

19 MR. LANCIOTTI: Object to form;
20 foundation.

21 A. I agree.

22 Q. And sitting here today, is it fair to
23 say that for the 95 percent, you don't know to
24 what degree any of those children were exposed to

1 undue lead levels; is that right?

2 MR. LANCIOTTI: Object to form.

3 A. Well, it is common sense -- forgive
4 me -- but if the water supply is carrying,
5 according to Marc Edwards' report, excess amounts
6 of lead, you said yourself that 25 percent
7 exceeded the MCL. Is that -- did I repeat that
8 right?

9 Q. No. I believe it was 20 percent.

10 A. 20 percent of the wells tested -- of the
11 sources tested had drinking water above the MCL,
12 then I would argue that at least 20 percent were
13 receiving undue lead from drinking water. They
14 may not have achieved the cutoff point here of
15 5 micrograms per deciliter, but if they were
16 drinking the water, they were getting undue
17 exposure.

18 Q. Sure. If they were drinking the water,
19 which is an important qualification, don't you
20 agree, Doctor?

21 A. Sure. I do.

22 Q. Okay. And are you aware that with the
23 change in water sources in April of 2014, that
24 there was also a change with the appearance,

1 taste, smell of the water?

2 A. Yes, I'm aware.

3 Q. Okay. And are you aware that that
4 change in appearance, taste, and smell led to a
5 number of Flint residents deciding to stop
6 drinking the water?

7 MR. LANCIOTTI: Object to form.

8 A. Just through the press.

9 Q. It's just through the press that you're
10 aware of that fact, right?

11 A. Yes.

12 Q. Okay.

13 A. Or public reports of some kind or
14 another.

15 Q. I understand.

16 And then if you keep looking at the time
17 frame here, after the switch but before the City
18 went back to Detroit water -- so I think it's the
19 third column that we're looking at, moving over
20 from left to right -- then the blood lead levels
21 dropped back down to 3.9 percent of children
22 having 5 or more micrograms per deciliter of lead
23 in their blood, right?

24 A. That's right. And this, it's my

1 understanding, is due to the water advisories, of
2 the need to boil water and to avoid the water
3 being provided at the tap.

4 Q. Would boiling water affect the amount of
5 lead in the water?

6 MR. LANCIOTTI: Objection to form.

7 A. It would only concentrate it.

8 Q. That's what I would expect, yeah.

9 That would have the opposite effect,
10 right?

11 A. Right.

12 Q. Okay.

13 A. If people were drinking it at all, yeah.

14 Q. Right. Exactly. Exactly.

15 Then going to the last column on the
16 right, after the switch back to Detroit water,
17 then there were still 1.4 percent of the children
18 tested had blood lead levels of 5 micrograms per
19 deciliter or more, right?

20 A. That's right.

21 Q. Okay. If a child in Flint did not have
22 their blood tested for lead content until
23 February of 2016, can you use that blood lead
24 level to determine whether or not they were

1 exposed to lead during the time frame that the
2 City was distributing water from the Flint River?

3 MR. LANCIOTTI: Objection; form and
4 foundation; beyond the scope of the expert's
5 testimony.

6 A. I would say no.

7 Q. So let's put that other -- thank you,
8 Doctor.

9 MR. TER MOLEN: Let's put the other
10 document up, Sam, which is another CDC document,
11 and it's the 2019 document, the Fourth National
12 Report on Human Exposure to Environmental
13 Chemicals.

14 - - -

15 (Graziano Exhibit 10 marked.)

16 - - -

17 BY MR. TER MOLEN:

18 Q. Is that a publication that you're
19 familiar with in general, Doctor?

20 A. Yes. It's not something that I seek
21 out, but, yes, I'm familiar.

22 Q. I assume it's not bedside reading.

23 A. No. It's good if you have insomnia.

24 Q. I'm sure.

1 MR. TER MOLEN: Okay. If we could --
2 let's see. Look at -- scroll on down there, and
3 if we can keep going down for, I think, a later
4 time frame.

5 Q. Okay. Can you describe generally,
6 Doctor, what your understanding of what this
7 document means?

8 A. Oh, gosh. No. Frankly, it's a
9 compilation of the statistics on blood lead
10 expressed in many manners in children of different
11 ages and different ethnic groups.

12 Q. Okay.

13 A. Age groups as well.

14 Q. And if we -- looking at that category
15 there -- it's near where the cursor is -- you see
16 "age 1 to 5 years, 2015 to 2016"?

17 A. Yes.

18 Q. And if you follow that across -- and
19 just some terminology here --

20 A. Can we enlarge this?

21 Q. You bet.

22 A. It's challenging my vision.

23 Q. And just in terms to make sure I
24 understand, Doctor, the --

1 MR. TER MOLEN: Whoops. I think we lost
2 the highlighting there, Sam. It should be the --
3 going up to the 1 to 5 years, 2015, 2016. Yep.
4 There you go. Thank you.

5 Okay. And if we scroll up a minute
6 there to see the columns -- the headings of the
7 columns.

8 Q. Okay. And so just the geometric mean,
9 is it fair to call the geometric mean an average,
10 Doctor, or is that something else?

11 MR. LANCIOTTI: Objection; form;
12 foundation.

13 A. That's fair.

14 Q. Okay. And then the 50th percentile
15 column there, that means that 50 percent of the
16 people in whatever the age category is are above
17 and 50 percent are below; is that right?

18 A. That's right.

19 Q. And this is looking at the nation as a
20 whole, right?

21 A. Yes.

22 MR. LANCIOTTI: Objection; form;
23 foundation.

24 A. As I recall.

1 Q. Yes.

2 So if you look at that line here, 1 to
3 5 years -- and this is looking at the 2015-2016
4 time frame -- and the 50th percentile there, the
5 blood lead level shown is .690, right?

6 A. That's correct.

7 Q. So that means that -- is it fair if I
8 call that .7?

9 A. Sure.

10 Q. And that means that 50 percent of the
11 population had blood lead levels above .7 and
12 50 percent had levels below that number, right?

13 A. Right.

14 Q. Okay. And, again, because this is from
15 the nation as a whole, this is looking at and
16 including areas that have brand-new housing, no
17 lead, et cetera, correct?

18 A. Correct.

19 Q. And if we were to look just at, on a
20 national basis, blood lead levels of children who
21 were living in older housing, i.e., before 1990,
22 you would expect to see, for the 50th percentile,
23 a higher blood lead level; is that fair to say?

24 MR. LANCIOTTI: Objection; foundation.

1 A. Yes, it is.

2 Q. Okay. Now, on a hypothetical basis,
3 Doctor -- and obviously we're talking about blood
4 lead levels below 1 and we were looking earlier at
5 the -- several reports in that regard, but if
6 there was -- if -- assuming a hypothetical
7 plaintiff in Flint whose blood lead level was
8 tested at -- in 2015 and found to be 0.7, okay,
9 that would be at, again, the 50th percentile on a
10 national basis, right?

11 A. Correct.

12 Q. So they would be right at the national
13 average; fair to say?

14 MR. LANCIOTTI: Objection; form;
15 foundation.

16 A. Yes.

17 Q. And if they were -- and if for this
18 hypothetical Flint plaintiff, a blood lead level
19 of 0.7 would actually be lower than what you would
20 expect to see on an average basis for a child who
21 was growing up in older housing stock such as
22 exists in Flint, right?

23 MR. LANCIOTTI: Objection; improper
24 hypothetical; beyond the scope of this expert's

1 report.

2 A. Depending upon the conditions of the
3 home.

4 Q. Sure.

5 And sitting here today, Doctor, would it
6 be your opinion that a child with a blood lead
7 level of 0.7 in 2015 suffered a loss to her
8 intelligence because of that level of lead?

9 MR. LANCIOTTI: Objection; form;
10 foundation; improper hypothetical.

11 A. Repeat the question, please, Mark.

12 Q. Sure.

13 Is it your opinion, Doctor, that a child
14 who suffered -- let me start over again.

15 Is it your opinion, Doctor, that a child
16 with a blood lead level in 2015 of 0.7 micrograms
17 per deciliter suffered a loss -- a permanent loss
18 to his or her intelligence because of that level
19 of exposure to lead?

20 MR. LANCIOTTI: Same objection.

21 A. Well, I would simply say that a child
22 with that blood lead level wouldn't be perceptibly
23 different than all of the other children in the
24 United States with that blood lead level.

1 Q. Okay. Fair enough.

2 So every other child in the U.S., you
3 would expect, would have -- well, I think you
4 phrased it well, Doctor.

5 This hypothetical plaintiff would be no
6 different than any other child in the
7 United States, right?

8 MR. LANCIOTTI: Objection; improper
9 hypothetical; and beyond the scope of this
10 expert's report.

11 You can answer.

12 A. I already answered the question.

13 Q. Okay. Well, I think you're agreeing
14 with me. Is that fair to say?

15 MR. LANCIOTTI: Objection; form.

16 A. I already answered the question.

17 Q. Now, you mentioned Marc Edwards.

18 A. Yes.

19 Q. Tell me who Marc Edwards is, please.

20 A. Marc Edwards is a -- I think he's a
21 civil engineer, professor at University of
22 Virginia or somewhere in Virginia. He was
23 previously known -- his name was known to me
24 because of his past work in Washington, D.C. with

1 an issue regarding lead in drinking water.

2 And as I read the documents, the
3 commission's reports and so forth, I came to -- I
4 came upon the papers that Marc and his group
5 published about their surveys about water lead
6 concentrations in Flint.

7 Q. Okay. Have you looked at any of the
8 work that Dr. Edwards did with respect to the City
9 of Flint besides the one study that you cite in
10 your paper on Page 3?

11 A. I don't believe so.

12 Q. Okay. Are you familiar with a term
13 called "biosolids"?

14 A. Yes and no. I can't -- don't ask me for
15 a definition, but the term is familiar to me.

16 Q. Okay. It is a relatively graphic term,
17 I guess, Doctor.

18 MR. TER MOLEN: We'll put up a document
19 that we'll mark as Exhibit 11, which is a 2019
20 study that Dr. Edwards did for -- with respect to
21 the City of Flint related to biosolids.

22 - - -

23 (Graziano Exhibit 11 marked.)

24 - - -

1 MR. TER MOLEN: If we could blow that up
2 a little bit, I'd like to give Dr. Graziano a
3 chance to read the abstract. Okay?

4 BY MR. TER MOLEN:

5 Q. Okay. Is that big enough for you to
6 see, Doctor?

7 A. Yes.

8 (Witness reviews document.)

9 Okay. This is not in my wheelhouse at
10 all, but...

11 Q. Okay. And if you go about halfway down,
12 do you see that -- let's see, right about that
13 line, starting with the word "months" there, Sam,
14 if you could go over to the right there.

15 It says "76 percent of the increase in
16 the lead measured in biosolids occurred in July to
17 September of 2014."

18 Do you see that?

19 A. Occurred in July to September of 2014,
20 yes.

21 Q. Okay. And obviously the switch in the
22 water source was done in April of 2014 and is --
23 at least as I'm understanding what Dr. Edwards is
24 saying in this part of the abstract, he's saying

1 that 76 percent of increases in the water lead
2 levels that were seen occurred during the time
3 frame in July through September of 2014.

4 Is that a fair reading?

5 MR. LANCIOTTI: Objection; form.

6 A. That's how I read it.

7 Q. Okay. And do you have any reason to
8 disagree with that conclusion?

9 MR. LANCIOTTI: Objection; form;
10 foundation.

11 A. This is just not in my expertise. This
12 is more water -- I don't know if it's chemistry,
13 but water management.

14 Q. Sure. Okay. I understand.

15 I'm going to show you another similar
16 paper that Dr. Edwards published earlier this
17 year.

18 MR. TER MOLEN: And we'll mark that as
19 Exhibit 12.

20 - - -

21 (Graziano Exhibit 12 marked.)

22 - - -

23 BY MR. TER MOLEN:

24 Q. Okay. I take it, Doctor, you've not

1 seen this paper before today; is that right?

2 A. That's right.

3 MR. TER MOLEN: If we can go to Figure 1
4 here, please.

5 Q. So this Figure 1, Doctor --

6 THE WITNESS: Could we just pause for
7 10 seconds? I just have to get a little closer to
8 the screen here.

9 MR. TER MOLEN: Sure. And we can expand
10 this a bit.

11 THE WITNESS: Okay.

12 BY MR. TER MOLEN:

13 Q. I'm going to focus on the lower of the
14 two graphs here connecting the red dots. Okay?

15 A. Yep.

16 Q. So this is showing in graphical form the
17 amount of lead that was measured in the biosolids,
18 basically. Okay?

19 A. Okay.

20 Q. And then do you see that there's a real
21 spike there going back to approximately 2011?

22 A. I do.

23 Q. Okay. And Dr. Edwards has interpreted
24 that spike to mean that there was a significant

1 exposure to Flint citizens back in 2011. And I
2 take it you're hearing that today for the first
3 time, right?

4 MR. STERN: Object to form; foundation;
5 beyond this witness's expertise.

6 A. Could you repeat it, please, Mark?

7 Q. Sure.

8 Doctor, had you heard of the potential
9 for a significant exposure to lead to Flint
10 residents in 2011 before today?

11 A. No, I had not.

12 Q. Okay.

13 A. Not from drinking water, anyway.

14 Q. Okay. Well, had you heard of a
15 significant exposure in 2011 from any other
16 source?

17 A. No. Just the historical legacy of the
18 old housing, likely presence of lead paint, which
19 we talked about this morning.

20 Q. Agreed.

21 By the way, Doctor, with respect to lead
22 paint, if a home is undergoing rehabilitation and
23 it has lead paint, would that rehabilitation be a
24 potential cause of significant exposure to lead?

1 MR. STERN: Object to form; foundation;
2 vague as to the term "rehabilitation." Objection
3 as to the speculation associated with any home.
4 Just generally object to the form of the question.

5 Q. Do you understand the question, Doctor?

6 A. Yes, I do.

7 It's certainly known that if lead
8 abatement is done improperly, it can lead to
9 exposure. If done properly, that exposure should
10 be absent.

11 Q. Okay. So if someone's doing work in
12 their home, they need to properly control for --
13 let me start over again.

14 If someone is doing some
15 construction-related work in their home, they need
16 to properly abate the potential for lead exposure
17 to avoid any undue exposures to lead associated
18 with that construction work, right?

19 MR. STERN: Object to form; foundation.
20 He just testified that if someone was doing lead
21 abatement and they weren't doing the abatement
22 properly, there was a potential for exposure. He
23 did not testify that if someone was doing
24 construction, they needed to do some type of

1 abatement. You're conflating his answer with your
2 next question, and it's extremely vague and
3 without foundation.

4 BY MR. TER MOLEN:

5 Q. Can you answer the question, Doctor?

6 A. Excuse me.

7 Homes that have lead paint on the inner
8 wall surfaces can provide a source of lead when
9 the surfaces are perturbed. I think that's as far
10 as I can say here.

11 Q. Okay. Understand. Understand.

12 Doctor, what about home demolition? If
13 a home is being demolished and that home has lead
14 paint, is it fair to say that proper abatement
15 measures need to be taken to avoid creating the
16 potential for exposure to lead associated with
17 that demolition work?

18 MR. STERN: Object to form.

19 Mark, are you asking him if the home
20 needs to be abated for lead prior to demolition?

21 MR. TER MOLEN: I think my question
22 speaks for itself.

23 BY MR. TER MOLEN:

24 Q. Doctor, do you understand the question?

1 A. I think so. Are you asking me should a
2 complete teardown of a home be a concern with
3 regard to lead exposure?

4 Q. Yes, exactly.

5 MR. STERN: Well, he clearly didn't --
6 the question didn't speak for itself if he had to
7 ask you about it.

8 But go ahead and answer, I guess.

9 A. I would say if a home contains lead and
10 the whole place is going to be obliterated and
11 torn down, then that lead is going to go someplace
12 into the environment and offer an opportunity for
13 exposure.

14 Q. Very good. Thank you.

15 You discuss work by Dr. Hanna-Attisha in
16 your report, right?

17 A. Yes.

18 Q. Okay.

19 MR. TER MOLEN: Let's pull that up, and
20 we'll identify that as Exhibit 13.

21 - - -

22 (Graziano Exhibit 13 marked.)

23 - - -

24 THE WITNESS: I'm familiar with the

1 paper.

2 MR. TER MOLEN: Thank you. I
3 understand.

4 BY MR. TER MOLEN:

5 Q. In your report on Page 4 -- and if you
6 want me to pull this language up, we can, Doctor,
7 but I'm just going to read it to you. You write
8 that -- bear with me a minute here -- that the
9 work reveals that the incidence of children having
10 blood lead levels greater than 5 micrograms per
11 deciliter, the EPA's level of concern, increase
12 from 2.4 percent before the switch to Flint River
13 water to 4.9 percent after the switch.
14 Neighborhoods with the highest water lead levels
15 suffered a 6.6 percent increase, and that -- well,
16 let me just stop there.

17 Do you recall writing that in your
18 report?

19 A. Yes.

20 Q. Okay. And you're just repeating what
21 Dr. Hanna-Attisha said in her study, right?

22 A. Exactly.

23 Q. Okay. And then you added in your
24 report, "No such changes were observed outside the

1 City of Flint," right?

2 A. Exactly. Again, quoting her.

3 Q. Okay. Are you familiar with who

4 Dr. Hanna-Attisha is?

5 A. Yes, I am. She gave a seminar at
6 Columbia in the department of pediatrics, so I
7 heard her present this, so I've seen her. I can't
8 say I know her.

9 Q. Fair enough.

10 You write in your report that the sample
11 size that Dr. Hanna-Attisha looked at had a total
12 of about 1,473 Flint children; is that right?

13 A. If that's what I said.

14 Q. Okay. Okay. I'd like to talk a bit
15 about a concept of seasonality with respect to
16 blood lead levels, Doctor.

17 Are you familiar with that term,
18 seasonality as it relates to blood lead levels?

19 A. Yes, I am.

20 Q. Okay. Can you explain to me what it
21 means?

22 A. Yes. There's a tendency for blood lead
23 concentrations to rise in the summer months that's
24 been known for decades. A long time ago, lead

1 poisoning used to be called "the summer disease."
2 In fact, there are papers about seasonality.
3 So -- and the mechanism for that is not completely
4 understood.

5 It's -- there are two hypotheses. One
6 is that it has something to do with Vitamin D, and
7 that when children are outside in the summer, we
8 make Vitamin D from ultraviolet light hitting the
9 skin, and that's how the synthesis of Vitamin D is
10 launched. And Vitamin D has some interactions
11 with lead and maybe it's that mechanism.

12 Or, alternatively, another hypothesis
13 has been that kids are simply outside more. And
14 this hypothesis was more dominant when we had
15 leaded gasoline and air leads were high. So one
16 line of thought was that it has something to do
17 with kids breathing in contaminated air.

18 Q. As you're saying, Doctor -- thank you
19 for that -- is you're saying on a national basis,
20 blood lead levels in children are higher in the
21 summer than they are the winter, fair?

22 A. Yes, fair.

23 MR. TER MOLEN: We'll introduce our next
24 exhibit here, Number 14, which is a paper by a

1 gentleman named Laidlaw from 2016.

2 - - -

3 (Graziano Exhibit 14 marked.)

4 - - -

5 BY MR. TER MOLEN:

6 Q. As Sam is putting that up, Doctor, let
7 me ask you, have you heard of the name Laidlaw and
8 his paper with respect to Flint?

9 A. It sounds familiar, but I -- if you show
10 it to me, I'll respond more fully.

11 Q. We're just going to scroll through
12 quickly to the end, Doctor, but if there is any
13 place you'd like us to stop, let me know.

14 Okay, Doctor. Just wanted to
15 double-check here again. Have you seen this paper
16 before?

17 A. I think I have, but --

18 MR. LANCIOTTI: Do you need more time,
19 Dr. Graziano?

20 THE WITNESS: Yeah. Give me a chance to
21 read the abstract.

22 Q. Sure.

23 A. (Witness reviews document.)

24 Okay.

1 Q. Okay. Does that refresh your
2 recollection at all, Doctor?

3 A. Yes, a bit. Yeah.

4 Q. Okay. Let me just ask you again. Have
5 you seen this paper before?

6 A. Yes. I recall seeing it. Not recently,
7 but, yes.

8 Q. Okay. I don't think I see this cited in
9 your report.

10 Is it cited in your report?

11 A. No, it is not.

12 Q. Okay. Is there a reason you did not
13 cite it in your report?

14 A. It just is a paper that flew by the
15 screen and went off the radar.

16 Q. Okay. And by the way you answered that,
17 if you had remembered this report when you were
18 drafting your -- I'm sorry. Let me start over
19 again.

20 If you had remembered this study when
21 you were drafting your report, would you have
22 cited it in your report?

23 A. Yes. Likely, yes.

24 Q. And that's because obviously it's

1 looking at blood lead levels in Flint, right?

2 A. Correct.

3 MR. LANCIOTTI: Object to form.

4 Q. Okay.

5 MR. TER MOLEN: Let's go to Page 3.

6 Q. And this chart, Doctor, I'm looking at
7 in the context of seasonality here, and, again,
8 you see there's an uptick in cases -- again, this
9 is looking at the United States as a whole --
10 there's basically an uptick in blood lead level
11 concentrations beginning in approximately May?

12 A. Yes.

13 Q. Okay. And then that goes through the
14 summer and starts going down, and then by
15 November, it's basically back to where it had been
16 in approximately January?

17 A. Yes. It's a well-known phenomenon going
18 back decades.

19 Q. Okay. Now, the City of Flint -- Doctor,
20 just looking at this chart, the City of Flint, as
21 we discussed, began distributing water in April --
22 the end of April 2015, right?

23 A. Right.

24 Q. Yeah. And I'm just speaking -- I'm

1 sorry -- beginning of April of 2014, right?

2 A. Yeah.

3 Q. Right?

4 And is it fair to say, Doctor, that that
5 time frame corresponds with what you would expect
6 to see as far as a seasonal uptick in blood lead
7 levels?

8 MR. LANCIOTTI: Objection; form;
9 foundation; vague.

10 A. Yes, indeed.

11 Q. Okay. Did Dr. Hanna-Attisha in her
12 study, Doctor -- and we can go back to this if
13 it's helpful -- did they try to control at all in
14 her study for the well-known seasonal increases in
15 blood lead levels?

16 MR. LANCIOTTI: Objection; form;
17 foundation. He's not the author of that, so...

18 A. Not that I recall, no.

19 Q. Okay.

20 MR. TER MOLEN: Let's go to Page 6 of
21 this report.

22 Q. Okay. Here -- if you look at this
23 figure, Figure 2 on Page 6 of this Exhibit 14,
24 Doctor, do you see the -- you see, obviously, the

1 graph that's here?

2 A. Yes.

3 Q. And if you look at the bottom, you see
4 that Dr. Laidlaw is charting blood lead levels for
5 the county of Genesee as a whole, right, which
6 includes the city of Flint. Also for the state of
7 Michigan as a whole, and then just for the city of
8 Flint by itself, right?

9 A. Yes, I do.

10 Q. And -- whoops -- as you look at the time
11 frame -- and if you see sort of the lower right of
12 this chart, there are those gold arrows going up
13 with the one on the left signaling the start of
14 the Flint River water usage in April of 2014, and
15 the one on the right indicating the City's return
16 to Detroit water in October of 2015, right?

17 A. Yes.

18 Q. Okay. And is it fair to say, Doctor,
19 that understanding that the spikes with respect to
20 blood lead levels for Flint are higher than the
21 spikes for Michigan and Genesee County, but that
22 the overall contours, the up and downs of the
23 graph, are the same for Genesee County and the
24 state of Michigan as a whole as compared to the

1 City of Flint?

2 MR. LANCIOTTI: Objection; form;
3 foundation; beyond the scope of this expert's
4 report.

5 A. The contours are the same, but the
6 absolute values in terms of the percent with blood
7 leads greater than 5 are clearly higher in Flint
8 than for Genesee County or for Michigan at large.

9 Q. Agreed.

10 Let's go back to the Hanna-Attisha
11 exhibit, which is Exhibit 13.

12 MR. TER MOLEN: Okay. If we can go to
13 Page 286, please.

14 Thank you, Sam.

15 Q. We'll look at this chart, Figure 1 here.
16 In looking at these groups, we've got several
17 different groups that are identified on this
18 chart, right?

19 A. Yes.

20 Q. There's -- on the left, it's "Outside
21 Flint," then there's "All Flint," then it's "High
22 Water Lead Level Flint," and then "Lower Water
23 Lead Level Flint," right?

24 A. Yes.

1 Q. Okay. And the "All Flint" group,
2 there's an increase there from 2.4 to 4.9 percent,
3 right?

4 A. Right.

5 Q. And in the "Outside Flint" group,
6 there's also an increase from 0.7 to 1.2, right?

7 A. Right.

8 Q. Now, it's fair to say, isn't it, Doctor,
9 that the group that's outside of Flint is, by
10 definition, not drinking the river water that
11 Flint was providing, right?

12 A. Right.

13 MR. LANCIOTTI: Objection to form;
14 foundation.

15 Q. Nonetheless, the -- that group almost
16 doubled, right? The levels almost doubled for
17 that group, right?

18 MR. LANCIOTTI: Objection to form.

19 A. Right.

20 Q. And do you recall, Doctor, in your
21 report that you were -- you wrote, citing
22 Dr. Hanna-Attisha, that no such changes were
23 observed outside the City of Flint.

24 Do you recall that?

1 A. I believe the changes outside were not
2 statistically significant, if I recall correctly.

3 Q. Okay. So the increase from 0.7 to 1.2
4 was deemed by somebody to not be statistically
5 significant?

6 A. As I recall, yes.

7 Q. Okay. Sitting here today, Doctor, and
8 seeing that we're looking at practically the
9 doubling of the percentage, would you agree that
10 that is not statistically significant?

11 MR. LANCIOTTI: Object to form.

12 A. The numbers determine whether it's
13 statistically significant or not, and that is
14 dependent, as we talked earlier, about statistical
15 power; are there enough children with blood lead
16 measurements. So -- and it's -- yeah. So if it's
17 not statistically significant, it's not
18 statistically significant; whereas, within Flint,
19 they are statistically significant.

20 Q. Okay. So would it be your
21 understanding, Doctor, that there simply wasn't
22 enough information to make a determination as to
23 whether the outside Flint category increased or
24 not in a statistically significant sense?

1 MR. LANCIOTTI: Objection; asked and
2 answered.

3 A. Well, the data as presented here
4 indicate -- in this manuscript indicate that there
5 was not a statistically significant change in
6 blood lead levels outside of Flint. I can't speak
7 to that any more than what the data are.

8 Q. Okay. The -- did Dr. Hanna-Attisha find
9 in her study that all parts of the City of Flint
10 were affected equally in terms of an increase in
11 blood lead levels?

12 MR. LANCIOTTI: Objection; form;
13 foundation.

14 A. I think this figure speaks to that
15 question, Mark, that she did not, that there are
16 clearly higher spikes in percentage of children
17 with elevated blood leads in areas that had higher
18 water lead concentrations.

19 Q. Okay. I think you're absolutely right,
20 Doctor.

21 MR. TER MOLEN: Let's go to Page 288
22 here.

23 Is this 288, Sam? I'm looking for
24 Table 2. Sorry. There we go. Thank you.

1 Q. And so this table is looking at water
2 lead levels --

3 A. Could we blow that up? I'm sorry.

4 Q. You bet. That's just fine, yeah. No
5 need to apologize.

6 This chart is looking at water lead
7 levels based on different wards in the city,
8 right?

9 A. Yes.

10 Q. And based on those water lead levels --
11 and there's a prediction as to what the blood lead
12 levels will be, right?

13 A. Just let me digest this for just one
14 moment.

15 Q. That's fine.

16 A. (Witness reviews document.)

17 Could you ask again, please?

18 Q. Sure.

19 Based on the water lead levels, this
20 chart then makes a prediction as to what the
21 predicted blood lead levels would be, right?

22 A. Yes.

23 Q. Okay. And the water lead levels, when
24 you look at this chart, some of them increased

1 after the change in water, correct?

2 A. Which columns are you -- could you point
3 me to --

4 Q. Sure.

5 If you look at the -- we've got -- let's
6 see. We've got the water lead level is the second
7 column on the right there, right after the ward,
8 obviously. Okay? And then the comparison here
9 that I'm going to look at is the change in
10 predicted blood lead level from pre to post.

11 Do you see that, the one on the far
12 right?

13 A. The far right, yes.

14 Q. Okay?

15 A. Yep.

16 Q. And so as you go ward by ward, some of
17 the blood lead levels are predicted to increase
18 because of a higher water lead level after the
19 switch in water sources, right?

20 A. Yes.

21 Q. And, interestingly, some of the blood
22 lead levels are predicted to increase because
23 after the switch in water sources, the water lead
24 levels were lower, right?

1 MR. LANCIOTTI: Object to form.

2 A. Yes.

3 I think you may have misspoke just now.

4 Q. Okay.

5 A. Can you repeat that?

6 Q. Sure. Let me -- instead of bothering
7 Sara here, let me just try to repeat it and make
8 sure I'm speaking correctly.

9 And in some of the wards, the --

10 MR. TER MOLEN: Whoops. Sam, I think
11 you're oversharing.

12 Q. In some of the wards, the blood lead
13 levels are predicted to decrease, right?

14 A. Yes.

15 Q. Okay. Indicating that the water lead
16 levels after the switch in water sources were
17 lower than they had been before the switch in
18 water source, right?

19 MR. LANCIOTTI: Object to form;
20 foundation; beyond the scope of this witness's
21 report.

22 A. I -- I guess so, yeah.

23 Q. Yeah?

24 Okay. All right. And so whether or not

1 any given Flint resident was exposed to higher
2 levels of lead via the water after the switch
3 versus before the switch would, based on this
4 study, be quite dependent on what ward they lived
5 in within the city, right?

6 MR. LANCIOTTI: Object to form;
7 foundation.

8 A. Yes. This is a modeling exercise,
9 right, predicted by ordinary Kriging
10 geostatistical analysis. That is a method that
11 I'm really not familiar with. That's outside my
12 expertise, so I can't be critical about it other
13 than to -- I don't disagree what the numbers say
14 and your opinion. And I agree, that's what the
15 numbers say.

16 Q. Okay. And then when you were preparing
17 your report, Doctor, did you do any research to
18 determine if there were other scientists who had
19 evaluated the work that Dr. Hanna-Attisha did?

20 A. I guess the answer is no.

21 Q. Okay. Sitting here today, are you
22 familiar with a gentleman by the name of Hernan,
23 H-E-R-N-A-N, last name Gomez, G-O-M-E-Z?

24 A. No.

1 Q. Okay. Did you look, Doctor, to see if
2 there were other scientists who had also studied
3 blood lead levels in Flint?

4 A. I believe I did, but I do not know the
5 name Gomez.

6 Q. Okay.

7 MR. TER MOLEN: Let's introduce the
8 first Gomez study from 2018, Sam.

9 - - -

10 (Graziano Exhibit 15 marked.)

11 - - -

12 BY MR. TER MOLEN:

13 Q. And just to go to the very top here,
14 Doctor, this is from the Journal of Pediatrics,
15 correct?

16 A. Yes.

17 Q. Are you familiar with that publication?

18 A. Yes, sir.

19 Q. It's a reputable publication?

20 A. Yes.

21 Q. Okay. I'll give you a chance to look at
22 this abstract here, Doctor.

23 A. Yeah.

24 (Witness reviews document.)

1 Okay.

2 MR. TER MOLEN: Okay. Let's go to
3 Page 161.

4 Q. Okay. In the "Discussion" section
5 here --

6 MR. TER MOLEN: I'm sorry, Sam. Thank
7 you.

8 If you go right underneath the
9 "Discussion" section, maybe if you can blow that
10 up a little bit, Sam. Thank you. Okay. Perfect.

11 Q. And we can go back and look at the
12 charts here in a minute, Doctor, but just to focus
13 on this language, "This investigation demonstrates
14 a substantial decline in both the percentage of
15 blood lead levels greater than or equal to 5.0 and
16 the geometric mean in children of Flint, Michigan
17 from 2006 through 2016."

18 Okay. Let me just stop there.

19 The fact that there was an overall
20 decline of blood lead levels of children in Flint,
21 Michigan from 2006 to 2016 would not surprise you
22 in the least, right?

23 A. Not at all.

24 MR. LANCIOTTI: Object to form;

1 foundation.

2 A. Not at all.

3 Q. Right?

4 And you'd expect that given the overall
5 decrease in the amount of lead in the environment,
6 right?

7 MR. LANCIOTTI: Object to form;
8 foundation.

9 A. Right.

10 Q. Okay.

11 MR. TER MOLEN: And so if we go up and
12 look at the chart here, Sam. I think it's a
13 little bit earlier. Go up a little farther.
14 Yeah, I'm sorry. I may be thinking of the next
15 study.

16 Why don't we go back down to that
17 language that we were reading.

18 Q. Okay. And then looking at the pairwise
19 percentage increases, is that phrasing something
20 that you're generally familiar with from your
21 work, Doctor?

22 A. Pairwise percentage increases? I need a
23 context for that.

24 Q. Okay. As we look at this chart,

1 Figure 1 --

2 MR. TER MOLEN: Thank you, Sam.

3 Q. -- on Page 160, I'll give you a minute
4 just to look at this, and you can let me know if
5 this is providing good context.

6 A. (Witness reviews document.)

7 Okay.

8 Q. Okay. So this chart is looking at
9 cohorts of children in three different segments,
10 right? Flint, state of Michigan as a whole, and
11 the United States, looking at the percentages of
12 children in each of those populations that have
13 blood lead levels greater than 5 micrograms per
14 deciliter, right?

15 A. That's right. I'm having difficulty
16 discerning -- oh, I see the color coding now.
17 Okay. Sorry.

18 Q. That's fine.

19 A. Yep.

20 Q. That's fine.

21 And so when -- just looking at the city
22 of Flint, which is the dark blue bar, obviously,
23 if you look at 2013, for example, on a percentage
24 basis, children in -- there was a lower percentage

1 of children in Flint with blood lead levels of
2 5 micrograms per deciliter or more than there was
3 in either the state of Michigan or the
4 United States, right?

5 A. Right.

6 Q. Okay. And when you go to 2015 there,
7 then basically the lines converge, right? You've
8 got essentially the percentage of children with
9 blood lead levels in Flint of greater than or
10 equal to 5 micrograms per deciliter is the same as
11 that percentage of children in the United States
12 and also that percentage of children in the state
13 of Michigan; is that fair?

14 A. That's fair. I'm having difficulty
15 understanding what -- understanding what the
16 asterisk means.

17 Q. Does it -- we can double-check here.
18 I'm not sure it has any meaning other than it --
19 there's an asterisk every time there's a number.

20 A. Oh, it's one for any adjust -- I see.
21 Okay.

22 Q. Yeah.

23 A. Got it.

24 Q. Okay.

1 MR. TER MOLEN: Thank you, Sam.

2 Okay. All right. Let's look at the
3 second Flint paper, Sam. We'll mark that as
4 Exhibit 16.

5 - - -

6 (Graziano Exhibit 16 marked.)

7 - - -

8 BY MR. TER MOLEN:

9 Q. Okay. This was published in the journal
10 Clinical Toxicology; is that right?

11 A. Yes.

12 Q. Are you familiar with that publication?

13 A. Yes.

14 Q. Okay. That's a reputable publication?

15 A. Yes.

16 MR. TER MOLEN: Sam, why don't you go
17 ahead and scroll through and we'll give
18 Dr. Graziano a chance to take a look at this.

19 Q. We'll just scroll through and then we'll
20 come back to the abstract, Doctor.

21 A. (Witness reviews document.)

22 Q. Let me know, Doctor, when you've had a
23 chance to read that.

24 A. Yep.

1 Okay.

2 Q. Okay. And so in this paper, Dr. Gomez
3 looks at three different 18-month time periods; is
4 that right?

5 A. Right.

6 Q. And he's looking to mirror the 18-month
7 time frame from the end of April of 2014 to
8 October in 2015 where the City of Flint was using
9 water from the Flint River as its water source,
10 right?

11 A. Right.

12 Q. Okay. And so to that end, he looks at
13 earlier 18-month intervals that cover the same
14 months and then looks at blood lead level data for
15 those time periods, right?

16 A. That's correct.

17 Q. Just understanding that, Doctor, is that
18 an appropriate focus of a study, in your view?

19 MR. LANCIOTTI: Object to form; vague.

20 A. That's an appropriate approach.

21 Q. Okay. And Dr. Gomez was looking at both
22 the mean blood lead level and also the percent of
23 children who had blood lead levels of greater than
24 5 micrograms per deciliter, right?

1 A. Right.

2 MR. LANCIOTTI: Object to form.

3 A. That's right.

4 Q. Okay. And like Dr. Hanna-Attisha, they
5 looked at all Flint as well as breaking the city
6 of Flint down by ward; is that right?

7 A. I didn't see the ward data per se, but
8 I -- yeah. I don't disagree.

9 Q. Okay. Let's look at Figure 1 here.

10 MR. TER MOLEN: Maybe blow it up just a
11 smidge, Sam. Great.

12 Q. Doctor, can you see that?

13 A. Yes, I can.

14 Q. Okay. And so, again, this is looking at
15 blood lead levels in the City of Flint for
16 children, of course, looking at those three
17 different 18-month intervals, right?

18 A. Right.

19 MR. LANCIOTTI: Dr. Graziano, would you
20 want to see the description of Figure 1? I think
21 we have to zoom in a little bit to get that.

22 THE WITNESS: This figure?

23 MR. LANCIOTTI: Yeah.

24 THE WITNESS: I see what it is.

1 MR. LANCIOTTI: Okay.

2 THE WITNESS: Yeah.

3 MR. LANCIOTTI: Thank you, Sam.

4 A. It's mean blood lead by ward over three
5 time periods.

6 Q. Okay. So let's look first at the "All
7 Flint" bar, which is the -- kind of the blue bar
8 there, right?

9 A. Yep.

10 Q. And back in 2006, the mean blood lead
11 level for children in Flint -- for all of Flint
12 was 2.9 micrograms per deciliter, right?

13 A. 2.9?

14 Q. I'm sorry. 2.19.

15 A. 2.19, yeah.

16 Q. Okay. Thank you. Appreciate that.

17 And then we move to the middle group,
18 looking at 2002, which is -- it goes from 2002 to
19 2013, which was -- the end of that time frame is
20 just a few months before the switchover in water
21 sources, right?

22 A. Correct.

23 MR. LANCIOTTI: I think it's 2012, you
24 meant, Mark.

1 THE WITNESS: Yeah, '12.

2 MR. TER MOLEN: 2012 to 2013. If I
3 misspoke, I'm sorry.

4 MR. LANCIOTTI: Right.

5 BY MR. TER MOLEN:

6 Q. And then the end of that time frame in
7 October of 2013 is just a few months before the
8 change in water sources, right?

9 A. Yes.

10 Q. Okay. And there, the mean for the
11 entire city is 1.47 micrograms per deciliter,
12 right?

13 A. Right.

14 Q. Okay. And then going over to the next
15 period, 3, which is looking at the actual time
16 frame when the City was using Flint River water as
17 its water source, the average blood lead level for
18 the entire city was 1.32 micrograms per deciliter,
19 right?

20 A. Right.

21 Q. And you see that little -- there's a
22 mark there above the blue bar that's called "OC"?

23 A. Yes.

24 Q. Do you know what that means, offhand?

1 We can look at the legend and break that down
2 here.

3 A. I don't know what that means.

4 Q. Okay. We'll come back to that in a
5 minute.

6 And if you look at -- sticking with
7 Figure 1, Doctor, for each ward in Flint, the mean
8 value reported for period 3, which is the time
9 frame when the City was using Flint River water,
10 is lower than it was for the immediately preceding
11 time period, right?

12 A. Yes.

13 Q. Okay.

14 MR. TER MOLEN: And if we go to the
15 "Discussion" here -- yeah. Thank you very much.

16 Actually, let's go to Table 2. Sorry.

17 Q. I'll give you just a minute to look at
18 this table, Doctor. If you are want us to blow
19 this up, just let me know.

20 A. It's fine. This is fine.

21 (Witness reviews document.)

22 Okay. Got it.

23 Q. And if you look at A here, A is the
24 percentage above 5 micrograms per deciliter,

1 right?

2 A. Right.

3 Q. And that's the exact measure that
4 Dr. Hanna-Attisha used, right?

5 A. Correct.

6 Q. Okay. Do -- does this study find a
7 statistically significant difference in the
8 percentage of children that had 5 micrograms per
9 deciliter blood lead levels or higher from
10 period 3, which is the actual crisis time frame,
11 versus period 2, which is the immediately
12 preceding 18 months?

13 A. No, it does not.

14 Q. Is it fair to say that Dr. Gomez's
15 findings in this paper conflict with those of
16 Dr. Hanna-Attisha?

17 MR. LANCIOTTI: Objection; form;
18 foundation.

19 A. The Hanna-Attisha paper did look at high
20 water lead levels and low water lead levels. And
21 in that regard, it's not exactly the same
22 analysis. I would say that this analysis
23 certainly is not supportive of her paper, but her
24 approach at looking at the geographic distribution

1 of children with elevated blood leads higher than
2 5 is a different approach, and one might argue a
3 more targeted approach based on what the water
4 lead concentrations were.

5 Q. Okay.

6 MR. TER MOLEN: Let's go to Page 793 if
7 we can, Sam.

8 MR. MYLER: I'm sorry, Mark. I got some
9 feedback from your mic. What page was that?

10 MR. TER MOLEN: Sorry. 793.

11 There we go.

12 Looking at the start of the "Discussion"
13 section here -- if you don't mind blowing that up
14 a bit. That's good.

15 BY MR. TER MOLEN:

16 Q. Okay. Doctor, just to read this first
17 part here, "Contrary to previous investigations
18 focused on examining defined samples of time
19 during the Flint water switch, we found that
20 geometric mean blood lead levels in young Flint
21 children actually decreased during the 18-month
22 water switch period compared to identical previous
23 time periods when controlling for length of time,
24 seasons, and months."

1 And you agree that that's what the data
2 showed, right?

3 A. That's correct.

4 Q. Okay. Sitting here today, do you have
5 any reason to take issue with the findings of this
6 study?

7 MR. LANCIOTTI: Objection to form;
8 foundation.

9 A. No. No, I do not. It's, you know,
10 conceivable, given the discussions that we've had
11 throughout the day with the reluctance of
12 residents to drink discolored water and the
13 episodes where water boiling requirements were put
14 out. And as you said, their inclination to drink
15 bottled water rather than to drink tap water, they
16 could contribute to the findings that we've just
17 looked at right now.

18 Q. Okay. Well, that's an interesting --
19 interesting hypothesis. Appreciate that.

20 Now, Doctor, I will tell you that
21 Dr. Hanna-Attisha's study looked at 736 children
22 before the water switch and at 737 children after
23 the water switch. Okay?

24 A. Yes.

1 Q. And I will tell you that Dr. Gomez in
2 his study looked at 1,834 children before the
3 switch and 1,734 children after the switch. Okay?

4 I think Sam's showing you here, if you
5 look under "Demographics."

6 Do you see that?

7 A. Yes, I do.

8 Q. Okay. And I think you testified earlier
9 today, Doctor, that studies with a larger sample
10 size are more statistically powerful, correct?

11 A. Correct.

12 MR. TER MOLEN: All right. Why don't we
13 take a break here, if that's okay with everybody
14 else. We're at a good break point for me. Why
15 don't we come back -- maybe a little more than
16 10 minutes here. Let's plan to be back on at
17 10 minutes before the hour. Okay?

18 VIDEOGRAPHER: The time is 2:36 p.m.,
19 and we're off the record.

20 (Recess taken.)

21 VIDEOGRAPHER: The time is 2:50 p.m.,
22 and we're on the record.

23 BY MR. TER MOLEN:

24 Q. Doctor, on Page 2 of your report, you

1 refer to a Needleman paper in 1979. I think we
2 touched base on this a little bit earlier, and you
3 reference that report as -- or that study as being
4 the first study to address what you call low-level
5 lead exposures.

6 Do you recall that?

7 A. Yes.

8 Q. Okay. Sitting here today, Doctor, do
9 you recall what lead level -- let me start over.

10 Do you recall what blood lead levels
11 were at issue in the Needleman report -- Needleman
12 study, rather, published in 1979?

13 MR. LANCIOTTI: Objection; foundation.

14 A. The 1979 Needleman study did not measure
15 blood lead levels. It measured lead in dentine in
16 teeth.

17 Q. Certainly in part.

18 MR. TER MOLEN: Why don't we pull up --
19 we can mark the '79 Needleman study as Exhibit 17.

20 - - -

21 (Graziano Exhibit 17 marked.)

22 - - -

23 BY MR. TER MOLEN:

24 Q. And this was published in The New

1 England Journal of Medicine, right?

2 A. I've heard of that. Yep.

3 Q. Exactly.

4 MR. TER MOLEN: Let's go to Page 4, if
5 we could, of this, Sam. Thanks.

6 Q. Okay. And bear with me here.

7 Here we go. In the paragraph right
8 above "Evaluation of Sampling Bias," do you see
9 that they also looked at the mean blood level in
10 1973 to 1974?

11 A. Yes.

12 Q. Okay. Does this refresh your
13 recollection that --

14 A. Records were obtained in previous --
15 records were obtained -- so they didn't -- they
16 obtained records, yeah. They didn't actually
17 measure at the time of the two Flint measurements.
18 But, yeah, go ahead.

19 Q. Okay. You agree, Doctor, that they do
20 have blood lead level results for the cohort that
21 was studied in this paper?

22 A. So these blood leads were prior blood
23 leads. Yeah, but they are -- they're there, and
24 they are what they were.

1 Q. Okay. And those range -- for the higher
2 level that was looked at in this paper, it was
3 35.5 micrograms per deciliter; is that right?

4 A. That's right.

5 Q. Okay. And then for the lower group, it
6 was 23.8 micrograms per deciliter?

7 A. That's right.

8 Q. Okay. Now, we've talked before, and
9 we'll talk again, about the pooled study, the
10 Lanphear 2005 paper that he rewrote or republished
11 in 2019, Doctor. And it sounded from the comments
12 you made earlier that you view that pooled
13 analysis as establishing that there may be a
14 causal link between lead exposure and effects on
15 intelligence at levels below 5 micrograms per
16 deciliter of blood lead; is that right?

17 MR. LANCIOTTI: Object to form.

18 A. That's right.

19 Q. Okay. Putting that paper aside, Doctor,
20 sitting here today, are you aware of any studies
21 that have looked at and tried to analyze the
22 effects of blood lead levels less than
23 5 micrograms per liter on the intelligence of
24 children?

1 A. You pointed out the Canadian paper using
2 the WPPSI in 3- and 4-year-olds.

3 Q. I did.

4 A. Yep.

5 Q. Okay. Other than that paper that we
6 looked at today, anything else that you're aware
7 of?

8 A. No.

9 Q. Okay. Now, we talked about
10 Dr. Lanphear, and you indicated you're familiar
11 with him and that you respect his work as an
12 epidemiologist focusing on lead, among other
13 things, right?

14 A. That's right.

15 Q. Okay. And Dr. Lanphear has obviously
16 done a number of studies looking at the effects of
17 lead exposure on children's intelligence, right?

18 A. Yes.

19 Q. And I'd like to show you portions of a
20 deposition that Dr. Lanphear gave in April of this
21 year. Okay?

22 A. Yep.

23 MR. TER MOLEN: We'll mark this as
24 Exhibit 18.

1 - - -

2 (Graziano Exhibit 18 marked.)

3 - - -

4 MR. TER MOLEN: Thank you, Sam.

5 Let's go to Page 207.

6 Okay. Thank you.

7 BY MR. TER MOLEN:

8 Q. So if you look at the bottom of 207,
9 Dr. Lanphear is being asked a question that, based
10 on the epidemiological studies, more likely than
11 not, somebody that has blood lead levels that are
12 consistently high will have experienced IQ
13 decrements, or to phrase it in a different way,
14 these plaintiffs would have had higher IQ scores,
15 and she, meaning the plaintiff, might have more
16 scholarships available to her and she might have
17 done better with her GPA.

18 "Do you recall giving that testimony?"

19 Answer from Dr. Lanphear, "Yes."

20 And then a couple of questions. The
21 first question was "First of all, would that
22 statement apply to somebody who does not have
23 consistently high blood lead levels? For example,
24 somebody who might be tested twice and have a

1 7 microgram per deciliter blood lead level
2 followed by a 15 microgram per deciliter blood
3 lead level?"

4 And the answer from Dr. Lanphear is,
5 "Well, based on today's standards, those are both
6 quite high."

7 Would you agree with what Dr. Lanphear
8 said in that first sentence?

9 MR. LANCIOTTI: Objection; form;
10 foundation.

11 I don't know what case this is or what
12 context this is being proposed for us here.

13 But, Dr. Graziano, if you can answer the
14 question, go ahead.

15 A. I don't agree with Dr. Lanphear's
16 answer.

17 Q. You do not? Is that --

18 A. I don't disagree. Sorry.

19 Q. You don't disagree. Okay.

20 And then he goes on to say in his answer
21 here, "If you had asked me instead, so I would say
22 generally, it would have still held true. If you
23 asked me whether somebody had a blood lead level
24 of 5 and 4 on points, then I would certainly have

1 less confidence that those -- that a child with
2 those blood lead levels would have sustained
3 injury."

4 Do you see that?

5 A. I do.

6 Q. Okay. Do you agree with Dr. Lanphear's
7 testimony on that point?

8 A. Well, the --

9 MR. LANCIOTTI: Objection; form;
10 foundation.

11 A. The word "injury" is a bit severe with
12 regard to what one might expect with exposures to
13 low blood levels. And I think, you know, when we
14 talk about loss of IQ points, is that injury? I
15 don't know. It's just -- the word sensitizes me.

16 Q. Okay. Well, assuming Dr. Lanphear is
17 talking about loss of IQ points here as injury,
18 would you agree with his statement?

19 MR. LANCIOTTI: Object to form;
20 foundation; improper hypothetical.

21 A. So let me read it again.

22 "If you had asked me whether somebody
23 had a blood lead of .5 and 4 on points" -- I'm not
24 sure I understand what that means, "on points."

1 Q. Well, why don't we assume for purposes
2 of my question, Doctor, that he's talking about
3 5 micrograms per deciliter and 4 micrograms per
4 deciliter.

5 A. ".5," he says.

6 Q. Well, for my question, I'm going to
7 assume he's talking about 5.

8 A. Okay. Then I would certainly have less
9 confidence that those -- that a child with those
10 blood leads would have sustained injury.

11 Well, I frankly am surprised by his
12 answer.

13 Q. Okay. Would you agree with it or
14 disagree with it?

15 MR. LANCIOTTI: Objection; form and
16 foundation.

17 A. Here again, I think the pooled analysis
18 and the -- and others have demonstrated levels of
19 concern below blood leads of 5.

20 Q. Okay.

21 A. Certainly between 5 and 10.

22 Q. Okay. So, again, are you disagreeing
23 with what Dr. Lanphear said or not? I just want
24 to make sure I'm clear, Doctor.

1 MR. LANCIOTTI: Objection; form;
2 foundation; and asked and answered.

3 A. Again, I don't know what he's -- his use
4 of the word "injury" just troubles me. I don't
5 agree with the term "injury."

6 MR. TER MOLEN: Okay. Why don't we look
7 at the next page here, Sam. And let's see. If we
8 can go to Page 210 here. Thank you.

9 Q. This gets into the issue of duration.
10 Okay?

11 A. Uh-huh.

12 Q. And we -- you talked about some -- I'll
13 use the phrase "toxicological maximums" a little
14 earlier, right? I think you used the phrase "the
15 dose makes the poison"; is that right?

16 A. Correct.

17 Q. And generally for purposes of
18 toxicology, there's the issue of dose on one hand
19 and duration on the other hand, right?

20 A. That's right.

21 Q. Okay. And with respect to lead and lead
22 exposure, duration is also important as to whether
23 or not exposure will result in any sort of effect
24 on a child's intelligence, right?

1 MR. LANCIOTTI: Object to form; vague.

2 A. That's correct, unless there is an acute
3 severe spike, like an acute poisoning. But for
4 the general population, that's correct.

5 Q. Okay. So then let's -- looking here on
6 Page 211, Dr. Lanphear is being asked some
7 questions. And we just -- I'm sorry.

8 MR. TER MOLEN: If you stick up there --
9 no, go back up there. Yep. Thank you.

10 MR. MYLER: 210?

11 Q. And so I guess my question is more
12 temporally, is there a time period that you put on
13 something being sustained as opposed to being more
14 acute?

15 Do you see that question, Doctor?

16 A. Just give me --

17 Q. On the left side there, Line 14.

18 A. Yep.

19 Q. And then answer: "Yes. Well, I use the
20 example of a 9-month-old girl who moved into a
21 recently renovated house. Her blood lead level
22 came back at 15. Her mom contacted me. She
23 immediately left the house. Two weeks later, it
24 was down to 2. That clearly is not sustained."

1 Do you see that?

2 A. I do.

3 Q. Okay. Do you agree with Dr. Lanphear's
4 testimony?

5 MR. LANCIOTTI: Object to form and
6 foundation.

7 A. Yes. I agree with that. It's -- the
8 half-life of lead in blood is a month, so it's, to
9 me, awfully surprising that it can go from 15 to
10 2, but if that's what it was, that's what it was.
11 Yeah, I agree.

12 Q. And then he adds, as you see there
13 starting in Line 22, "When I talk about sustained,
14 it's weeks to months, not days to weeks."

15 Do you see that?

16 A. Yeah.

17 Q. And do you agree with that?

18 A. I agree with that.

19 Q. Okay. And when Dr. Lanphear used the
20 term "sustained" here, what he meant was -- and we
21 can look at this on Page 210 -- it was not
22 sufficient -- it was not a sufficient duration of
23 exposure to cause lasting harm.

24 Is that how you understand it as well?

1 MR. LANCIOTTI: Object to form and
2 foundation.

3 A. Yes, I understand it that way.

4 Q. Okay. Have you ever seen a blood lead
5 level result, Doctor, that came back with a
6 reading of less than 3 micrograms per deciliter?

7 A. Sure.

8 Q. Can you explain to me what you would
9 understand that result to mean?

10 A. I would understand that to mean that the
11 child's blood lead is less than the EPA's level of
12 concern.

13 Q. Okay. And you mentioned a level of
14 detection earlier in the context, I think, of your
15 own laboratory, and if I recall right, you said
16 your own level of detection is 1 microgram.

17 A. I misspoke on that. I definitely
18 misspoke on that.

19 Q. Okay. Okay. Is it lower, in fact, than
20 1?

21 A. It's on the order of .1.

22 Q. I see. Okay. Well, that's fine,
23 Doctor.

24 Are you aware of some facilities --

1 MR. TER MOLEN: Rick, I think your mic
2 is on.

3 MR. BERG: Oh, thank you. Sorry.

4 MR. TER MOLEN: That's okay.

5 BY MR. TER MOLEN:

6 Q. Doctor, are you aware of some laboratory
7 facilities that have a detection limit that is on
8 the order of 3 micrograms per deciliter?

9 A. That's conceivable. Yeah, that tells me
10 that their technology is old, but, yeah, that's
11 not surprising.

12 Q. And did you reference a minute ago,
13 Doctor, an EPA standard, if I heard you right, of
14 3 micrograms per deciliter?

15 A. No, I did not.

16 Q. You -- if I --

17 A. What I was -- I'm sorry. If I said EPA,
18 I meant CDC.

19 Q. Okay.

20 A. Yeah.

21 Q. Isn't the CDC level a Number 5?

22 A. Yes, it is.

23 Q. Okay. So just going back again, if a
24 result came back at less than 3, do you have --

1 sitting here today, do you have any understanding
2 of what 3 would be in relation to?

3 A. So the Number 5 is simply a --
4 5 micrograms per deciliter is a bit of a red flag
5 that public health officials should go and try to
6 seek out the source of exposure because the child
7 is not behaving -- is not in the typical range of
8 blood leads. So it's a mark in the sand that we
9 should be concerned that there's a source that may
10 be preventable.

11 Q. And that's the Number 5, right?

12 A. Yes.

13 Q. Okay. And so, again, I'm just going to
14 go back to the Number 3.

15 Are you aware of any reason to focus on
16 the Number 3?

17 A. No.

18 Q. Okay. We talked earlier -- you talked
19 earlier, Doctor -- let me ask a different
20 question.

21 If you're looking at a single blood lead
22 level result, Doctor -- and let's say it is this,
23 less than 3 micrograms per deciliter. Okay?

24 A. Yep.

1 Q. If you're looking at that in itself in
2 isolation, is that enough information to tell you
3 that a child has been exposed to concerning
4 quantities of lead?

5 MR. LANCIOTTI: Object to form;
6 foundation; improper hypothetical.

7 A. In and of itself, no.

8 Q. Okay. Isn't it fair to say, Doctor,
9 that you would really need to have at least two
10 different blood lead level results separated in
11 time to establish a level -- both a level of
12 exposure, a dose, and a duration to make any
13 potential conclusions as to whether or not, in
14 fact, damage had occurred from lead exposure?

15 MR. LANCIOTTI: Object to form and
16 foundation; improper hypothetical.

17 A. ... a single point in time leaves you
18 uncertain about the duration of exposure. It
19 could have been higher before the measurement was
20 taken, and it may well be just a single aberrant
21 blip.

22 Q. Right. The earlier part of your answer
23 may have gotten cut off. I don't know.

24 MR. TER MOLEN: Sara, did you have some

1 interference on your end?

2 THE STENOGRAPHER: Yes, I did.

3 MR. TER MOLEN: Yeah? Okay.

4 Q. I'm just going to ask you, Doctor, if
5 you don't mind just to repeat your answer.

6 MR. TER MOLEN: Or Sara, if you don't
7 mind reading back the question and then we can go
8 there.

9 I'm sorry, Doctor. There was some
10 interference when you started speaking, and we
11 just lost the first part of your answer.

12 THE WITNESS: Sure.

13 (Record read back as requested.)

14 MR. LANCIOTTI: Same objection.

15 A. And my -- excuse me.

16 My answer is that, yes, you would really
17 like to have two points in time because that
18 single blood lead level of 3 might actually be --
19 may have been higher earlier. You can't know. Or
20 it may actually be the peak, not knowing. So you
21 really would like to have additional information.

22 I've seen plenty of children back in
23 their days when New York City, when we were doing
24 our clinical trials, where you come to realize

1 when by the time the child came to our clinic, we
2 had a blood lead measurement that was actually on
3 the decline. Prior to arriving at our clinic, the
4 child had had much higher.

5 So you can't tell which way it's going
6 and how long the duration is.

7 Q. Sure. Understand.

8 On Page 5 of your report, Doctor, and,
9 again, I can show this if you want to, but you
10 write that the steepest decline in IQ function
11 occurs in the very low blood lead range.

12 Do you recall that?

13 A. I do.

14 Q. And what do you mean when you use the
15 phrase "very low blood lead range," if you can
16 explain, please.

17 A. Well, I think the dose-response
18 relationship, if you look at -- if I had a piece
19 of paper, but if you look on the Y axis, plot
20 blood lead from zero to 50, and on the -- I'm
21 sorry. On the X axis, plot blood lead from zero
22 to 50, and on the Y axis, child IQ, virtually all,
23 as I recall, of the seven prospective studies see
24 a very steep decline in the low blood lead range,

1 10 or 15 and less, and then a flattening of the
2 curve as the blood lead goes above 15 or so. By
3 that, I don't mean a single point measurement of a
4 single blood lead, but typically an average blood
5 lead over a period of the longitudinal study of
6 the child.

7 Q. Sure.

8 And, Doctor, obviously we looked earlier
9 today at a Canadian paper you were seeing for the
10 first time, right, that was looking at blood lead
11 levels below 1 and indicating that there was no
12 correlation there with lead exposure and any
13 measurable IQ loss, right?

14 A. At age 3, right.

15 Q. At age 3, yeah.

16 And so that would -- and, Doctor,
17 sitting here today, do you know, going back to the
18 pooled study that you were talking about, how
19 many -- of the subjects collectively that were
20 looked at in the seven different cohorts that were
21 included in the pooled study, how many of those
22 had blood lead levels below 7.5 micrograms per
23 deciliter?

24 MR. LANCIOTTI: Objection; foundation.

1 A. Without looking at the paper or the
2 data, I can't recall that.

3 Q. What's the -- do you recall
4 approximately, Doctor, the overall number of
5 subjects who were included in that pooled
6 analysis?

7 MR. LANCIOTTI: Objection; foundation.

8 A. I think I have a note.
9 1333.

10 Q. Okay. And, Doctor, if I told you that
11 only 103 of those had blood lead levels below
12 7.5 micrograms per deciliter, would that surprise
13 you?

14 MR. LANCIOTTI: Objection; form;
15 foundation.

16 A. No.

17 Q. Okay. Well, isn't it fair to say,
18 Doctor, that it's -- a pool of 103 is a pretty
19 small pool to make conclusions with respect to
20 effects below 7.5 micrograms per deciliter?

21 A. But the construction --

22 MR. LANCIOTTI: Sorry.

23 Object to form; foundation.

24 Go ahead, Doctor.

1 A. The construction of that dose-response
2 curve does not ignore all of the children above
3 7.5. The construction of the curve is powerful
4 because we have a wide range, and that's -- that's
5 the nature of the pooled analysis.

6 Q. Well, I understand that you're -- in
7 your view, the curve, as you call it here, has a
8 number of data points, well over a thousand data
9 points, it sounds like, as you go above
10 7.5 micrograms per deciliter. But as you get
11 below 7.5 micrograms per deciliter, it gets pretty
12 sparse because we're talking only 103.

13 MR. LANCIOTTI: Objection; form;
14 foundation.

15 A. I don't disagree, but the statistical
16 modelers who have spent careers trying to fit
17 curvilinear functions to a dataset like this have
18 convinced me that they are able, with great
19 confidence, to construct a curve. You can't just
20 look at a tiny window of the curve. You look at
21 the entire range of the curve.

22 Q. Well, I appreciate that. And I
23 appreciate that statisticians can accomplish many
24 things. And I'm often reminded of the Mark Twain

1 quote, right, that there's lies -- damn lies and
2 statistics, right?

3 So -- but as you look at the actual --
4 you would agree, Doctor, would you not, that
5 statistics has to take a second chair to actual
6 results, right?

7 MR. LANCIOTTI: Objection to form.

8 A. Well, statistical analysis is part of
9 the means by we get to actual results.

10 Q. I understand. And I agree with that,
11 Doctor. The -- and I think we're actually all
12 saying -- or you and I are saying the same thing
13 here, that when you talk about the curve and you
14 talk about -- and you look at projecting that down
15 below 7.5, it really is -- it's a projection,
16 right?

17 MR. STERN: Objection; form; move to
18 strike the colloquy. There's only one individual
19 testifying today, so there should be no agreement
20 about anything insofar as there's only one person
21 testifying.

22 A. Can you restate your question, Mark?

23 Q. Sure.

24 As the curve, as you call it, gets below

1 7.5 micrograms per deciliter, Doctor, you agree
2 it's a -- it's a projection?

3 A. It's a statistical representation of all
4 of the data, including the data above 7.5 and the
5 data below 7.5.

6 Q. Okay. And to take your phrase, Doctor,
7 the steepest decline in IQ function occurs in the
8 very low blood lead range.

9 Does that effectively mean that the
10 initial exposure causes the most damage?

11 MR. LANCIOTTI: Objection; form.

12 A. No. You are referring to temporal
13 issues, Mark. You know, these longitudinal
14 cohorts have very good repeated measurements of
15 blood lead in children again and again. Our
16 study, we measured blood lead every six months
17 from the umbilical cord blood lead measurement at
18 6, 12, 18, 24, so on, measurements.

19 And so when we're talking about a
20 number -- a blood lead number, it's not at a
21 single point in time. It's often an integrated
22 average over a block of time over some duration.

23 Q. Thank you. I appreciate that, Doctor.
24 Why don't we go at this with some hypotheticals.

1 That might make it a little easier here. Okay?

2 So let's hypothetically assume that we
3 have a child age 4 who has a blood lead level of
4 2 micrograms per deciliter, and that -- and she's
5 tested three times over six months and
6 consistently has a blood lead level of 2. Okay?

7 A. Yeah.

8 Q. And is it your testimony that a blood
9 lead level of 2 micrograms per deciliter would
10 cause lasting harm to the child's intellectual
11 functioning?

12 MR. STERN: Object to form; foundation.

13 Are you asking him in that moment that a
14 child with a lead level of 2, or a child who has a
15 lead level of 2 today but previously had a lead
16 level of 4; and 30 days earlier, 8; and 30 days
17 earlier, 16; and 30 days earlier, 32; and 30 days
18 earlier, 64?

19 MR. TER MOLEN: I'm asking the question
20 I asked.

21 Q. Can you answer that question, Doctor?

22 A. I'm sorry. I'm going to ask you to
23 repeat the question.

24 Q. Sure.

1 MR. TER MOLEN: Sara, do you mind
2 reading it back?

3 (Record read as requested.)

4 A. It's conceivable that it could cause a
5 very, very small loss in the child's intellectual
6 capacity, but not much at all.

7 Q. Okay. Okay. Let's look at Page 6 of
8 your report, Doctor. There you write, in part,
9 that the molecular and physiological effects of
10 lead are well understood.

11 Do you recall that?

12 A. Yes, I do.

13 Q. Okay. And is that a recent development,
14 Doctor?

15 A. No. It goes back at least 20 --
16 20 years or more.

17 Q. Okay. And you cite a paper by a
18 gentleman by the name of Klassen published in
19 2018, if I'm pronouncing that correctly.

20 A. Yeah. Kurt Klassen. That's actually a
21 textbook. I refer to a chapter in a textbook that
22 talks about molecular mechanisms.

23 Q. Okay. And you cite the Klassen text as
24 discussing numerous mechanisms, I think, to use

1 your phrasing, that are involved in altering brain
2 function from lead exposure; is that right?

3 A. That's right.

4 Q. Okay. Can you -- are you able, sitting
5 here today, to describe to us what those
6 mechanisms are?

7 A. To some extent, sure.

8 So -- and this work is largely derived
9 from animal models because you can't get inside of
10 a person's brain and look.

11 But lead interferes with many
12 neurotransmitter functions, the dopaminergic
13 neurotransmitters, the cholinergic
14 neurotransmitters. And it mimics calcium in the
15 brain. There's a group at Johns Hopkins back in
16 time who studied protein kinase C, which is a
17 calcium dependent, critically important enzyme in
18 brain development and functioning. And their
19 review article -- I just looked at it not -- their
20 review article has been cited -- this is -- oh,
21 Goldstein is one of the authors, but it's been
22 cited 800 or 900 times as others in the field move
23 forward and look at molecular mechanisms.

24 Q. Okay.

1 A. I believe to some extent it interferes
2 with the reuptake of neurotransmitters at the
3 synapse.

4 Q. Okay. Does Klassen's text support a
5 claim, Doctor, that there is no threshold for
6 effects of lead on brain function?

7 A. No, because this is all animal-modeled
8 work.

9 Q. Okay. And similarly, is it fair to say
10 that the Klassen text does not support a claim
11 that the effect of lead is greater at lower doses
12 of exposure than at higher doses of exposure?

13 A. Not that I recall.

14 Q. Okay.

15 A. I mean, this was an examination of
16 molecular mechanisms. I don't recall exactly.

17 Q. Fair enough.

18 Are you familiar, Doctor, with different
19 EPA action levels for lead in the water?

20 A. Going back in time, you mean? The
21 evolution of the MCLs, you mean?

22 Q. No. Thank you. I'm sure that would be
23 a fascinating discussion, but maybe just focus
24 currently, what the MCLs are currently, Doctor,

1 for lead.

2 A. The MCL is 15 micrograms per deciliter.

3 Q. Okay. And is that an action level?

4 A. So I'm trying to remember the Lead and
5 Copper Rule and what the implications are of
6 having a water lead above 15, and I can't remember
7 exactly what the actions are. But attention is
8 brought to the matter.

9 Q. Okay. And, Doctor, is it -- well, are
10 you able to convert consumption of -- are you able
11 to convert a water lead level, if you will, into a
12 blood lead level?

13 MR. LANCIOTTI: Objection; form;
14 foundation.

15 A. One can estimate the ingested dose. We
16 use the norms of how much water a child of that
17 age or an adult of that age typically drinks. And
18 there are, you know, established values that we
19 assume a child would drink. I used to know it,
20 but I don't.

21 Q. That's okay.

22 Is there a model out there, do you know,
23 that's sanctioned by EPA? Is it called IUBKE,
24 something like that?

1 A. IEUBK, yes.

2 Q. Well, I was close. Thanks.

3 Okay. And is that a model that does
4 what you're describing, which converts,
5 essentially, water lead levels into blood lead
6 levels?

7 A. The IEUBK model can incorporate water
8 lead concentrations in the prediction of blood
9 lead concentrations in children. It's essentially
10 based -- the model is based on communities in
11 which -- that have been studied extensively where
12 they know the soil lead concentration, they know
13 the air lead concentration, they know the dust
14 lead concentration, they know the water lead
15 concentration. And when all put together, if you
16 take those values for a community and plug them
17 into the model, you can actually predict what the
18 frequency distribution of blood lead in children
19 will look like.

20 I served on a National Research Council
21 committee some years ago. Perhaps this is too
22 long of a story, but the IEUBK model was
23 challenged by the senators from Idaho. It was the
24 Coeur d'Alene, Idaho Superfund site. And there

1 had been a Superfund site in the so-called
2 Silver Valley of Idaho, in the panhandle, that
3 25-square-mile site was cleaned up over a period
4 of 20 years.

5 During that process, EPA came to learn
6 that lead tailings from the mine had moved down
7 the river toward the Coeur d'Alene River. And EPA
8 declared the entire length of the Coeur d'Alene
9 River to be another Superfund site, at which point
10 the two senators went nuts because they had just
11 rebuilt that area to become tourist -- tourism was
12 a big part of the economy.

13 And so the senators got the national
14 academy to convene a committee. And actually,
15 they were challenging EPA on this very model, on
16 the IEUBK. And to make a long story short, the
17 committee, which was a very distinguished
18 committee, actually came to conclude that that
19 model was a very useful model in predicting the
20 distribution of blood leads in children.

21 Q. Thank you. I appreciate hearing that.

22 The -- would you agree that the MCLs
23 issued by the government are meant to be
24 protective?

1 A. Yes.

2 MR. LANCIOTTI: Object to form.

3 Q. And sitting here today, do you know if
4 somebody was drinking water that had 14 parts per
5 billion of lead in it, what that would translate
6 into as far as their blood lead?

7 A. I do not.

8 MR. LANCIOTTI: Object to form.

9 A. I cannot.

10 Q. And, Doctor, are you aware that the FDA
11 regulates the lead content of bottled water?

12 A. Yes.

13 Q. Okay. And, similarly, is that
14 regulation intended to be protective, in your
15 view?

16 A. I would certainly hope so.

17 Q. Do you know what that level is?

18 A. I do not offhand. I did, but I don't.

19 Q. Okay. If I told you 5 parts per
20 billion, would you accept that?

21 A. Sure. Sounds reasonable.

22 Q. Okay. And sitting here today, do you
23 have any opinions as to whether or not drinking
24 bottled water with 5 parts per billion of lead is

1 safe?

2 MR. LANCIOTTI: Object to form.

3 A. I have not specifically considered that.

4 Q. Okay. Fair to say that you drink
5 bottled water without worrying about that; is that
6 right?

7 MR. LANCIOTTI: Object to form;
8 foundation.

9 A. I don't, but I would. Yep.
10 I'll give you a factoid, Mark.

11 Q. Please.

12 A. The amount of energy that is used to
13 create a bottle of water is equivalent to a third
14 of a bottle of oil.

15 Q. Really?

16 A. Yes. When one considers the amount of
17 energy to obtain the water, make the plastic,
18 transport the bottle and so on. So it should be a
19 deterrent to all of us to not drink bottled water.

20 Q. Well, I've got to use my thermos more
21 often; that's for sure.

22 A. And using -- going back to your
23 Mark Twain, you reminded me of Harry Truman, who
24 always wanted a one-handed economist, because he

1 said the economist, "On the one hand, and on the
2 other hand..."

3 Q. We looked earlier at a document, Doctor,
4 that was the -- oh, let's see. It was the -- I
5 want to say it was the 2019, or maybe it was a
6 2016 -- it was one of the CDC summaries looking at
7 blood lead levels, and we were looking at national
8 blood lead levels. And you recall that we looked
9 at the 50th percentile?

10 A. .7, yes.

11 Q. Yes, right. Good memory.

12 Would you call .7 a low blood lead level
13 or is that sort of a super low blood lead level,
14 if you will?

15 MR. LANCIOTTI: Objection; form.

16 A. Well, I'm an old-timer, you know. In
17 historical context, it's a very low blood lead
18 concentration.

19 Q. Yeah.

20 And obviously you cited the Needleman
21 paper in '79 that we looked at earlier that was
22 looking at, quote, unquote, low blood levels, but
23 as we looked at in that paper, the blood lead
24 levels, in fact, were in the 23 to 35 micrograms

1 per deciliter range, right?

2 A. Back in the lead gasoline year.

3 Q. Yeah, back in -- just before -- well,
4 just at the end of that era, I guess, right? Just
5 the end of the '70s.

6 MR. TER MOLEN: Okay. Now, I'd like to
7 look at a couple of documents here. This will be
8 Exhibit 19.

9 And it's a 2019 report from -- it might
10 be the Michigan Department of Public Health, but
11 we'll see that in a minute here, looking at blood
12 lead levels at different parts in the state of
13 Michigan. Okay?

14 - - -

15 (Graziano Exhibit 19 marked.)

16 - - -

17 BY MR. TER MOLEN:

18 Q. Okay. Department of Health and Human
19 Services. Close.

20 MR. TER MOLEN: Thank you, Sam.

21 Q. Have you seen this document before,
22 Doctor?

23 A. No, I have not.

24 Q. Okay.

1 MR. TER MOLEN: If we could turn to
2 Page 7. I think it's -- is that Page 7, Sam?
3 Sorry. Here we go.

4 Q. So this is a chart --

5 MR. TER MOLEN: If you can blow that up
6 a smidge. Thank you.

7 Q. -- a chart that's looking at blood lead
8 level results by county.

9 Do you see that?

10 A. Yes.

11 Q. And if you look at the last column all
12 the way in the right, that identifies the number
13 of children in that county who were tested -- and
14 this is, again, focusing on 2014 -- for lead and
15 had blood lead level results -- the percentage
16 that had blood lead level results higher than
17 5.0 micrograms per deciliter, right?

18 THE WITNESS: Could I stop us right
19 here? I would like one minute to put drops in my
20 eyes, because --

21 MR. TER MOLEN: Doctor, why don't we
22 just -- thank you. That's just fine. We'll take
23 a break. Why don't we come back at a quarter to
24 the hour. Okay? Just give you a bit more time.

1 THE WITNESS: Thank you very much.

2 VIDEOGRAPHER: The time is 3:35 p.m.,
3 and we're off the record.

4 (Recess taken.)

5 VIDEOGRAPHER: The time is 3:45 p.m.,
6 and we're on the record.

7 BY MR. TER MOLEN:

8 Q. Okay. Terrific. I think we were
9 looking at the exhibit we marked as Number 19,
10 which was a chart with some small numbers that I
11 think drove you to eye drops.

12 A. That's right.

13 Q. And I think I'd asked you, Doctor, if
14 you would confirm that the column to the far right
15 there is identifying the percentage of children in
16 any particular county within the state of Michigan
17 who have a blood lead level of 5 micrograms per
18 deciliter or more, right?

19 A. Just -- just give me one moment, please.
20 (Witness reviews document.)

21 You're referring to the very far right?

22 I see, percent BLL greater than 5. Yep.

23 Q. Okay. And if we scroll down here --
24 we'll look for Genesee County.

1 And you understand, Doctor, that
2 Genesee County is the county in which the City of
3 Flint is located?

4 A. I do.

5 Q. Great.

6 Okay. You see Genesee there is at
7 2.6 percent?

8 A. Yes, sir.

9 Q. Okay. And then just looking down that
10 same page, you see "Jackson," a little bit farther
11 down?

12 A. I do.

13 Q. Okay. And Jackson, obviously, is much
14 higher at 5.6 percent, right?

15 A. Right.

16 MR. LANCIOTTI: Objection; form.

17 MR. TER MOLEN: Okay. And if we go to
18 the next page there -- I'm sorry. The next page.
19 Thank you, Sam. Keep scrolling down. There we
20 go. Oh, scroll up a little bit. We'll start with
21 the L's. We'll still be with the L's. Look for
22 "Lenawee." There we go.

23 Q. You see Lenawee County there? It's
24 10.2 percent?

1 A. I do.

2 Q. And then if we go down to Mason, you
3 see, is 6.5, and then we've got a couple other
4 high ones right there -- or higher ones.
5 Menominee, 6.1; Muskegon, also 6.1.

6 Do you see those?

7 A. I do.

8 Q. Okay. And they separately list out
9 Detroit.

10 MR. TER MOLEN: And if we can see -- if
11 we can keep going down, I think we'll see Detroit,
12 Sam.

13 A. I see it.

14 MR. TER MOLEN: Right there.

15 Q. Okay. And you see Detroit is 8.2?

16 A. Yes.

17 Q. Which is -- oh, gosh, that's almost
18 three times higher than the -- than
19 Genesee County, right?

20 A. Right.

21 MR. LANCIOTTI: Object to form.

22 A. Right.

23 Q. Okay.

24 MR. TER MOLEN: And if you go to Page 11

1 here, Sam. Thank you.

2 Q. This is talking about cities that
3 received specific funding for lead prevention. So
4 this looks at -- this includes Flint, which is
5 breaking Flint up from Genesee County, and you see
6 Flint is higher than the county as a whole, right?

7 A. Yes.

8 Q. At 4.5, and that's just a little bit
9 less than half of what Detroit is, right, at 8.2?

10 A. Right.

11 Q. And then you see the other cities here.
12 Highland Park is, obviously, much higher
13 at 15.9, right?

14 A. Right.

15 Q. I'll introduce the next exhibit,
16 Exhibit 20. And this is going to be the same kind
17 of information, Doctor, but for the subsequent
18 year, 2015. Okay?

19 A. Okay.

20 - - -

21 (Graziano Exhibit 20 marked.)

22 - - -

23 MR. TER MOLEN: Let's go to Page 19
24 here.

1 And if we can scroll down again to
2 Genesee County.

3 BY MR. TER MOLEN:

4 Q. And you see Genesee is 2.3?

5 A. Yes.

6 Q. So they actually declined a bit over the
7 previous year, correct?

8 A. I don't recall what the sample size was
9 in the previous year, but, yes. For what it's
10 worth, yes.

11 Q. Okay. And then once again, we can
12 scroll through this.

13 MR. TER MOLEN: If you go to the next
14 page and look at Lenawee -- there we go --

15 Q. It's -- down there it's 10.

16 MR. TER MOLEN: A little bit higher up.

17 Q. The county of Kent, you see that, is
18 6.2?

19 MR. TER MOLEN: And if we go to Page 22.

20 Q. Again, the City of Detroit is identified
21 separately here, and that's at -- 7.5 percent of
22 the children in Detroit had blood lead levels of
23 5 micrograms per deciliter or higher, right?

24 A. Right.

1 Q. Okay. And, Doctor, would you expect,
2 just focusing on the children in the City of
3 Detroit, if a child -- well, you know what? We'll
4 leave that alone.

5 We'll get to one of the moments we've
6 been building up to, Doctor, which is the
7 Lanphear 2005 study.

8 Now, you mentioned that report -- you
9 mention that study in your report, obviously.
10 We've talked about it a number of times today.
11 And he published that pooled study in -- initially
12 in 2005, right?

13 A. That's correct.

14 Q. And he republished it in 2019, correct?

15 A. That's correct.

16 Q. And the reason he republished it in 2019
17 was to address some errors identified by another
18 scientist by the name of Crump, C-R-U-M-P; is that
19 right?

20 A. That's right.

21 Q. Okay. You were a coauthor of the
22 2005 study, right?

23 A. And the second study, yeah.

24 Q. Okay. Well, that's what I was going to

1 ask you.

2 So you were also a coauthor of the
3 second study, right?

4 A. That's correct.

5 Q. And so when you say in your report that
6 you were careful not to cite your own work,
7 obviously this is an exception to that, right?

8 A. Yes. Okay. That was a slip.

9 Q. Okay.

10 MR. TER MOLEN: Why don't we put in the
11 2005 study. We'll mark that as Exhibit 21.

12 - - -

13 (Graziano Exhibit 21 marked.)

14 - - -

15 MR. TER MOLEN: And let's look at the
16 abstract, Sam, if we can.

17 Thank you.

18 A. Okay.

19 Q. So reading about halfway down here,
20 Doctor -- let's see -- it would be 12 lines from
21 the bottom here. There's a sentence that starts
22 "Using a log-linear model, we found a 6.9 IQ-point
23 decrement associated with an increase in
24 concurrent blood lead levels from 2.4 to

1 30 micrograms per deciliter," right?

2 A. Right.

3 Q. And so just to restate that in more
4 layman's terms, when the blood lead level of a
5 particular child increased from 2.4 to 30, you
6 found a loss of IQ points of almost 7. 7 IQ
7 points; is that right?

8 A. Yes.

9 MR. LANCIOTTI: Object to form.

10 A. In -- in populations of children, if you
11 compare those with 2.4 to a 30, the mean drop in
12 IQ was 6.9.

13 But, if we go on, much of that decrement
14 in IQ happens on the lower end of that range of
15 2.4 to 30.

16 Q. Okay. Thank you. I do see that.

17 And so the increase from 2.4 to 10,
18 which is, what, 7.6, the increase from 10 to 20,
19 which is 10, and the increase from 20 to 30, those
20 increases were respectively -- or the loss of IQ
21 points associated with those increases was
22 respectively 3.9, 1.9, and 1.1; is that right?

23 A. That's right. So it's in that lowest
24 range of 2.4 to 10, that much of the segment, that

1 the damage was done.

2 Q. Okay. And just to be clear, the study
3 here focuses on -- with the lowest level I see
4 identified here for purposes of looking at losses
5 in IQ points is 2.4 micrograms per deciliter,
6 right?

7 MR. LANCIOTTI: Objection; form;
8 foundation.

9 A. That's not the lowest blood lead of any
10 child. That's just -- you know, this is just a
11 means of trying to make a very complicated issue
12 interpretable to the reader. I don't know if
13 that's useful, but, you know, any reviewer will
14 say, well, put it in -- put the result in terms
15 that anybody can understand. We're not talking
16 about a child with a 2.4 and a child with a 10.
17 But if you model the dose-response curve, as the
18 statisticians did, this is what the model shows.

19 Q. Sure.

20 And I appreciate, Doctor, that we're
21 talking at a population level and not an
22 individual level, right?

23 A. Yeah. Right.

24 Q. Okay. I appreciate you're not looking

1 at any individual child and indicating what IQ
2 loss they may or may not have, which is, I think
3 in part, what you're saying, right?

4 A. That's right.

5 Q. Okay. And obviously as we discussed
6 earlier, there's a large number of other factors
7 that can come into play.

8 But the question I'm getting at, Doctor,
9 is understanding this study is at a population
10 level, that the focus of the study, the lower
11 level of blood lead that was looked at in the
12 study was 2.4, right? And then that went on up
13 from there, correct?

14 A. No. That's not --

15 MR. LANCIOTTI: Objection; form;
16 foundation.

17 A. That's not correct.

18 Q. Okay. Why is it not correct? Because
19 I'm looking in here -- and I appreciate this is
20 the abstract. If there's more in the text, we
21 can -- you can direct me there as the coauthor
22 here.

23 But, again, the abstract, as I'm reading
24 it, as we read it together, is using 2.4 at the

1 lower level and going up from there, right?

2 A. Yes. And that's -- that's for
3 illustrative purposes. It's not as though we
4 didn't look at blood leads lower than that, or
5 that the model didn't create a curve that went
6 below that. I'm sure you'll eventually get to the
7 figures in the paper, which may be more helpful.

8 Q. Okay. Well, I understand that the model
9 may have created a curve, but where -- can you
10 show me -- and we can scroll through here -- can
11 you show me where in the paper it purportedly
12 studies IQ decrements below 2.4 micrograms per
13 deciliter?

14 A. I think we need to look at the figures.

15 Q. Okay.

16 A. So here we have descriptive data for
17 Boston, Cincinnati, Cleveland, Mexico, Australia,
18 Rochester, Yugoslavia.

19 But I'd like to go to the graphics. I
20 don't know which figure number it is.

21 Okay. So these -- these models -- and
22 they are models -- look at the one, Figure 3 here.
23 It depicts a model that creates the dose-response
24 curve IQ versus, for example, concurrent blood

1 lead across a range that goes down well below 2.4.
2 And I think the surprise to all of us -- not a
3 total surprise, because individual studies had
4 seen this relatively steep drop-off in the range
5 below 10, but we looked at this in different ways.
6 Concurrent blood lead, if you scroll down a little
7 bit. In Figure 4, modeling it, looking at those
8 with peak blood leads higher than 10, the solid
9 line, and less than 10, importantly, that fine
10 dotted line, that's where the model shows the
11 steepness of the curve for blood leads lower than
12 10. And it does go down -- all the way down to,
13 you know, very small numbers.

14 Q. Okay. Anything else you want to show
15 me, Doctor, that illustrates -- besides these
16 models, that illustrates where this study purports
17 to study blood lead levels below 2.4 micrograms
18 per deciliter?

19 A. No.

20 Q. Okay. So going back to the abstract,
21 Doctor, why did -- why did you as an author here
22 choose 2.4 as the starting point?

23 MR. LANCIOTTI: Objection; form; asked
24 and answered.

1 A. Honestly, I don't recall.

2 Q. Okay. Then has anybody re-examined the
3 data that was collected in this study and reached
4 a different conclusion regarding the relationship
5 between low-level lead exposure and health
6 effects?

7 A. The EPA conducted a reanalysis of this
8 same data, and EPA concluded -- in fact, this
9 occurred after the reanalysis, you know. So there
10 was an error here. The Boston group, the Harvard
11 group, when they submitted their data to
12 Dr. Lanphear, whoever sent the data over didn't
13 send full-scale IQ. They -- so IQ scores have
14 subscales, performance IQ and verbal IQ. And they
15 inadvertently sent the performance IQ rather than
16 the full IQ, which encompasses performance and
17 verbal.

18 So the analysis was redone. And after
19 it was redone, the result of the subsequent
20 publication really reiterated essentially the same
21 findings. The numbers were tweaked by a tiny bit.
22 But EPA then reanalyzed that corrected dataset and
23 concluded that the errors did not change the
24 overall results or the scientific validity or the

1 conclusions.

2 Q. Okay. Well --

3 A. And I'm essentially quoting from the EPA
4 document.

5 Q. Okay. Appreciate that.

6 MR. TER MOLEN: Let's introduce the next
7 exhibit, which will be Exhibit 22. And this will
8 be the 2013 study by Crump that was analyzing this
9 2005 study that's Exhibit 21.

10 - - -

11 (Graziano Exhibit 22 marked.)

12 - - -

13 BY MR. TER MOLEN:

14 Q. Okay. You've seen this document before,
15 right, Doctor?

16 A. Yes, I have.

17 Q. Okay. And you cite to the Crump study,
18 I believe, in Page 5 of your report in this case,
19 right?

20 A. I believe so.

21 Q. Okay. You don't engage in any
22 discussion of what the Crump study says, though,
23 correct?

24 A. Not to any extent, no.

1 Q. Okay.

2 MR. TER MOLEN: Let's go to Page 793 of
3 this, Sam.

4 Q. Okay. There's some highlighted language
5 there. And starting at the beginning of the
6 paragraph, Doctor, in which the highlighted
7 language is, it says that "the confidence
8 intervals on the coefficients plotted in
9 Figure 3" -- we'll go back to Figure 3 in a
10 minute -- "naturally get progressively larger for
11 progressively lower blood lead levels owing to the
12 fact that each subsequent point is based upon
13 fewer children."

14 A. Exactly.

15 Q. Pardon?

16 A. Exactly. Yep.

17 Q. And then it says "Below peak blood lead
18 levels of around 4 to 6 micrograms per deciliter,
19 the confidence intervals become so wide that they
20 provide essentially no information."

21 Did I read that correctly?

22 A. Yes, you did.

23 Q. Okay. And by saying that "the
24 confidence intervals become so wide that they

1 provide essentially no information," is it fair to
2 say that what Crump is saying is that once you get
3 below 4 to 6 micrograms per deciliter, there's
4 insufficient data to determine whether or not
5 there is any harm?

6 MR. LANCIOTTI: Objection; form;
7 foundation.

8 A. Well, this is their opinion. This is
9 their opinion, and it is without question that the
10 confidence intervals become wider as you go lower
11 and lower. These are -- these authors are
12 hired -- you know, it's a consulting firm, and
13 they reached this opinion. Even
14 Sir Bradford Hill, if one reads his original --
15 what was a lecture and became a paper -- argues
16 strongly at the end of his lecture, his paper,
17 that one should not rely religiously on
18 statistical significance and that one needs to
19 look at the whole set of criteria that we talked
20 about earlier.

21 And so they can come down on this side
22 of their conclusion. I can't dispute it. But it
23 is -- at that point in time, it's a matter of
24 opinion. Here again, because there's so much

1 confidence in the data just above the 4 to 6 and
2 the modeling brings it into the shape that it is,
3 you know, I'll give them their opinion -- I'm
4 entitled to mine -- but it gets down to that,
5 basically.

6 Q. Okay. I think I understand. Thank you,
7 Doctor.

8 And just to restate what I think I heard
9 you say is that when you get down to the levels of
10 4 to 6 micrograms per deciliter of blood lead,
11 that Crump wrote that the data is not sufficient
12 to identify any harm?

13 MR. LANCIOTTI: Objection; asked and
14 answered; mischaracterizes the witness's
15 testimony.

16 A. That is mischaracterizing what I said,
17 yep.

18 Q. Okay.

19 A. You know, we're taught always to look at
20 the source of funding for scientific publications.
21 You know, our work was funded by the National
22 Institutes of Health. This work, it's a
23 consulting firm. I don't know who funded them to
24 do this, to try to attack. They did a reasonable

1 job of reanalyzing the data and recreating the
2 same dose-response curve. Their interpretation at
3 the low end of the curve is different than mine.

4 Q. Okay. So as I think you said, it's a
5 matter of interpretation, right?

6 A. Yes.

7 Q. Okay. And then later in that same
8 paragraph, Crump writes, "however" -- and I'm
9 just -- here we go -- yeah. I'm sure we're on
10 Page 798.

11 Okay. So starting in this paragraph
12 here --

13 MR. TER MOLEN: Thank you, Sam.

14 Q. -- Lanphear, et al. stated that they
15 found no evidence but threshold exposure below
16 which blood lead levels has no association with
17 IQ.

18 And we've talked about that some today,
19 right, Doctor?

20 A. Yes.

21 Q. Okay. And the next sentence is "There
22 appears to be nothing in our analysis to challenge
23 this conclusion."

24 A. Good.

1 Q. And then he says "However, the question
2 of whether or not a threshold of exposure exists
3 can never be answered definitively by a
4 statistical analysis."

5 Did I read that correctly?

6 A. And he refers to his own work, which I'm
7 not familiar with, the Crump 2011.

8 Q. Okay. But I read that correctly, right?

9 A. Yes.

10 Q. Do you agree with that?

11 MR. LANCIOTTI: Objection; form.

12 A. I'm not a statistician. This is beyond
13 my pay grade in terms of the statistical analysis.

14 Q. Okay. And then later in that same
15 paragraph --

16 MR. TER MOLEN: We can move down here.

17 Q. -- he writes --

18 MR. TER MOLEN: Yeah, thank you, just
19 over to the right there.

20 Q. -- "However, it is possible to use a
21 statistical analysis to set an upper bound for any
22 threshold that may exist."

23 Do you see that?

24 A. Yes.

1 Q. And then he writes "The present analysis
2 suggests an association of blood lead level with
3 IQ at concurrent blood lead levels as low as
4 5 micrograms per deciliter."

5 A. Yes.

6 Q. Do you see that?

7 Okay. And that's -- his view of what
8 the science shows is that you can see a decrement
9 to IQ where you have a blood lead level as low as
10 5 micrograms per deciliter, right?

11 MR. LANCIOTTI: Objection; form.

12 A. Could you repeat your question?

13 Q. Sure.

14 He writes that based on his review of
15 the same data that you and Dr. Lanphear looked at,
16 that that data indicates that all the way down to
17 5 micrograms per deciliter, it's possible to find
18 an association between lead exposure and loss of
19 IQ, right?

20 A. Right.

21 MR. LANCIOTTI: Object to form.

22 Q. Okay. And the flip of that is he did
23 not see a scientific basis for finding harm below
24 5 micrograms per deciliter, correct?

1 MR. LANCIOTTI: Object to form.

2 A. I think we've talked about that already,
3 Mark.

4 Q. Okay. This is where it's a matter of
5 opinion.

6 MR. TER MOLEN: Okay. Why don't we
7 introduce the next exhibit, which will be
8 Exhibit 23. And this is the 2019 version of the
9 paper you coauthored with Dr. Lanphear.

10 - - -

11 (Graziano Exhibit 23 marked.)

12 - - -

13 BY MR. TER MOLEN:

14 Q. Now, with apologies if you've explained
15 this already, Doctor, why was it necessary to
16 republish the paper from 2005, essentially
17 15 years later?

18 A. Because in -- along the way -- and I
19 suspect it was Crump and coworkers -- when they
20 looked -- so we provided all of the data to the
21 EPA and to other groups to say, here, take a look,
22 see what you see. And a very astute observer
23 noticed that there was an error -- an honest error
24 in that Harvard group -- the Boston group provided

1 the performance IQ, as I've said, rather than the
2 full IQ.

3 So this analysis was taken on again, the
4 reanalysis, and so this paper starts with an
5 explanation of what the errors were and goes on to
6 explain that, you know, essentially we reran
7 everything we had done many years ago and that the
8 changes in the outcome, in the scientific
9 conclusions were essentially vanishingly small.
10 And as I said, EPA took the second dataset and
11 reanalyzed it and concurred with us that the
12 errors did not change the overall results or the
13 scientific validity or the conclusions.

14 Q. Okay. Well, we'll come back to this in
15 just a second.

16 MR. TER MOLEN: Sam, if you don't mind
17 putting up Page 5 from Dr. Graziano's report in
18 this case, please.

19 Q. Okay. Just looking at this -- the
20 paragraph that's sort of -- whoops, there you
21 go -- that's highlighted here, you say "combined
22 pool analysis," and then you say in the second
23 line, "and subsequently modified in 2019 due to a
24 small error in the original analysis."

1 Do you see that?

2 A. I do.

3 Q. Okay. And when we just read the
4 document here -- and I'm not trying to -- did you
5 mean to say -- instead of "small error," Doctor,
6 did you mean to say "due to errors," plural, in
7 the original analysis?

8 A. My mistake. There was one other really
9 small error, but, yeah.

10 Q. Okay.

11 MR. TER MOLEN: Let's go back to the
12 2019 review. Thanks. Thanks, Sam.

13 Q. Okay. And then if we scroll down,
14 there's an editor's note here that might be --
15 there we go -- where it says "Due to the extent of
16 the changes throughout the text and the length of
17 time that has passed, the complete corrected text
18 of the article is included for the convenience of
19 our readers. Supplemental material is also
20 provided," et cetera.

21 So, basically, it sounds like that given
22 the time that had passed, the editors asked you
23 guys to, in essence, redo and resubmit the full
24 paper; is that fair?

1 A. That's fair.

2 Q. Okay. And then, you know, in that --
3 you know, again, you indicated earlier, I think,
4 that there's a lot of work that's been done in
5 this area in recent years.

6 Is there -- did you, when you
7 republished this paper in 2019, try to take into
8 account all of the various studies that had looked
9 at low-level lead exposure since the original
10 paper was published in 2005?

11 A. To my recollection, we did not. This
12 was an erratum, if you will, and we did not try to
13 reinvent the wheel. We were trying to get the
14 original story absolutely as accurate as we could.
15 And if I recall, the editors -- when -- I didn't
16 speak to them, but Lanphear did -- this was what
17 they wanted. They didn't want to see a completely
18 new rewrite. It would have been easier for them
19 just to go with the former paper.

20 Q. Okay. That's really interesting to me,
21 I guess, Doctor. I mean, part of the reason why
22 is I've always thought of, you know, science, it's
23 an incremental process. Right? There's always
24 new studies and new information, right?

1 A. Sure.

2 MR. STERN: Object to form; move to
3 strike the colloquy.

4 Q. And you agree, Doctor, that there were a
5 number of studies with respect to lower-level lead
6 exposure that occurred between the time that the
7 initial paper was published in 2005 and the time
8 the follow-up paper was published in 2019, right?

9 A. That's correct. But they would not have
10 changed one iota the interpretation of the data
11 that we were presenting.

12 Q. Okay. Well, let me ask you. Are you
13 aware of any papers published between 2005 and
14 2019 that reached conclusions different from those
15 reached in the 2005 initial pooled study?

16 A. Based on this data?

17 Q. Based on any data.

18 A. Certainly not based on this data.

19 Offhand, no, but I -- I don't know what
20 you're getting at.

21 Q. Okay. Well, we looked today at two
22 studies, right, that reached -- that --

23 A. Canadian, yeah.

24 Q. Yep. The Canadian study, yep. And

1 there was an earlier study by Taylor that also was
2 looking at low-level blood lead levels.

3 And are you familiar with the paper by
4 Lourdes, L-O-U-R-D-E-S, Schnass, S-C-H-N-A-S-S?

5 A. The names are certainly familiar.

6 Q. It was published in 2006, looking at low
7 lead levels with respect to affecting
8 intelligence.

9 A. I -- it's familiar. I cannot recall it.

10 Q. Okay. What about the name Min, M-I-N, a
11 paper in 2009; are you familiar with that?

12 A. I don't recall.

13 Q. Okay. A paper by Kordas, K-O-R-D-A-S,
14 published in 2011; are you familiar with that?

15 A. Again, it's familiar. It's nine years
16 ago. I don't recall.

17 Q. Okay. And another paper by Brann,
18 B-R-A-N-N, published in 2012; are you familiar
19 with that?

20 A. No.

21 Q. Okay.

22 A. The power of the Lanphear publications,
23 however, is that it -- these are seven extremely
24 long longitudinal studies, each of which, on their

1 own, saw dose-response relationships between lead
2 and IQ, and then when combined, they represent
3 data from, as I said earlier, many cities, many
4 countries, different cultures. And I would hold
5 this up to any one other study that's not
6 longitudinal and of this duration.

7 Q. I appreciate that.

8 And, Doctor, let me ask you, with
9 respect to publishing scientific studies, you
10 earlier were indicating some questioning as to the
11 funding source of the folks of Crump and his
12 group, right?

13 A. I wasn't pointing fingers per se. I
14 just say we -- we have learned, whether we're
15 studying tobacco or lead or whatever, that be wary
16 of who is funding the work and conducting --
17 conducting the analysis.

18 Q. Well, I think -- and as part of that, I
19 take it you're in favor of transparency on the
20 part of the authors with respect to any potential
21 conflicts of interests; is that right?

22 A. Definitely.

23 MR. LANCIOTTI: Object to form.

24 Q. And is it fair to say, Doctor, that on

1 your behalf, you would disclose any potential
2 conflicts of interest if you were in the process
3 of publishing a paper, right?

4 MR. LANCIOTTI: Object to form.

5 A. We are required to do so.

6 Q. Okay. And just by way of a
7 hypothetical, then, Doctor, if you were retained
8 by plaintiff's counsel in a lead case and while
9 you were retained, you were publishing a paper
10 that linked lead exposure to injury, would you
11 make a disclosure of the fact that you were a
12 retained plaintiff's expert?

13 MR. LANCIOTTI: Object to form;
14 foundation; improper hypothetical.

15 A. Yes, I would be required to do that.

16 Q. Yeah, okay. When you say you would be
17 required to do that, do you mean pursuant to
18 university rules or something else?

19 A. University rules.

20 Q. Okay. And don't the publications
21 themselves have rules requiring disclosure of
22 potential conflicts of interest?

23 A. Absolutely.

24 Q. Okay. And you'd expect that anybody who

1 was publishing a paper where they had been
2 retained by outside interests, that they would
3 need to disclose that retention by outside
4 interests, right?

5 A. Right.

6 Q. Okay.

7 A little earlier, Doctor, we talked
8 about the category of neurological diseases later
9 in life.

10 You recall that, right?

11 A. That's right.

12 Q. And I think you indicated that you're
13 not opining today that there is a causal
14 relationship between lead exposure and any of the
15 neurological diseases later in life, right?

16 A. That's correct.

17 Q. With respect to the schizophrenia issue,
18 your report cites two papers published by a
19 gentleman -- I think a gentleman -- you can tell
20 me if I'm wrong -- by the name of Opler,
21 O-P-L-E-R?

22 A. Mark Opler was my Ph.D. student.

23 Q. Okay. Terrific. Good first name.

24 And those papers were published in 2004

1 and 2008, right?

2 A. As I recall.

3 Q. And are you aware that those papers were
4 looking at groups who had been exposed to lead
5 that resulted in their having blood lead levels
6 greater than 15 micrograms per deciliter?

7 MR. LANCIOTTI: Objection; foundation.

8 A. As best as I can recall. It's a long
9 time ago.

10 Q. Yeah.

11 Okay. And with respect to essential
12 tremor, you cite two papers published by Louis in
13 2003 and 2011?

14 A. Elan Louis, yes.

15 Q. Okay. And the median age of the
16 respondents in those papers was mid-60s to early
17 70s; is that right?

18 A. That is correct.

19 MR. LANCIOTTI: Objection; foundation.

20 A. Yes, as I recall.

21 Q. Yeah. And so it's fair to say that they
22 would have grown up in the 1930s and 1940s?

23 A. That's right.

24 Q. And you would consider -- you would

1 expect that individuals growing up at that point
2 in time would have had relatively high blood lead
3 levels; is that right?

4 A. That's right. And I believe the papers
5 actually make that point, that they likely had
6 higher exposure to lead.

7 Q. Doctor, I'm having a little trouble
8 hearing you. If you're able to speak up a little
9 bit. Thank you.

10 A. Sorry.

11 I believe the papers actually point that
12 out, that we, of course, given their ages,
13 envision that they had higher exposures as young
14 people.

15 Q. Okay. I think you indicated this
16 earlier, Doctor, that the half-life of lead in
17 blood in adults is about 30 days?

18 A. That's a complicated question, Mark.
19 There were actually two half-lives. The half-life
20 of lead in blood -- let me illustrate this. And
21 the best illustration is some work -- take
22 somebody who has worked in -- with lead through
23 occupational exposure, a battery worker. And that
24 fellow retires, and we longitudinally measure that

1 fellow's blood lead over time. We see that blood
2 lead comes down initially with a half-life of
3 roughly a month. But after about four, five, six
4 months, the trajectory of the curve changes and it
5 now has a second half-life, a much longer
6 half-life. The second half-life is on the order
7 of four years.

8 And what that is reflecting is the fact
9 that at that point after his exposure had stopped,
10 blood level comes down, but now it's -- lead in
11 bone is an equilibrium with lead in blood. You
12 know, we remodel bone all day long every day, and
13 by that, I mean, you know, we have microfractures
14 and bone cells that are repairing that. And in
15 the process, they actually liberate some of the
16 lead in bone.

17 So the initial half-life is about a
18 month for four to six months, but then -- and
19 there's this long, long half-life. So that's why
20 in these cases, these papers with essential
21 tremor, these guys have low blood leads on the
22 order of 2 and 3. That lead in their blood is
23 likely actually coming out of the bone reservoir
24 that was built up a long time ago.

1 Q. Understand.

2 And that's why you'd expect the bone
3 lead reservoir, so to speak, would have to be
4 relatively large to result in blood lead levels
5 like what they were seeing, right?

6 A. Yes. Larger than under current exposure
7 paradigms.

8 Q. Yeah. Exactly. Exactly.

9 In 2012, you coauthored a paper on
10 predicting later life outcomes of early life
11 exposures; is that right?

12 A. Yes.

13 Which -- who is the first author?

14 MR. TER MOLEN: Well, Sam, why don't we
15 put that one up.

16 A. Is it Kim Boekelheide?

17 Q. It is, actually. It is, yeah. I wanted
18 you to pronounce that first, Doctor.

19 A. Yeah. That was actually a conference
20 proceeding. It wasn't a study per se.

21 Q. Okay.

22 A. But it was a report back from a
23 conference on that issue of consequences of early
24 life exposure later in life.

1 MR. TER MOLEN: Okay. Why don't we put
2 that up and we'll mark that as an exhibit.

3 Q. Doctor, by calling it a conference
4 report, is that a document that would have gone
5 through peer review?

6 A. Absolutely.

7 Q. Okay.

8 MR. TER MOLEN: We'll mark this as
9 Exhibit 24.

10 - - -

11 (Graziano Exhibit 24 marked.)

12 - - -

13 A. I haven't seen this one in a long time;
14 Mark, you're taking me through my career here.

15 Q. Well, it's a very accomplished career,
16 Doctor.

17 And is it fair to say, Doctor, that this
18 paper provided some examples where early life
19 exposures to various substances could cause health
20 effects later in life?

21 A. As I recall, yes.

22 Q. Okay. Did any of the examples discussed
23 in the paper involve lead exposure?

24 A. I don't recall. I -- by your

1 questioning, I presume the answer is no, but I
2 don't recall.

3 MR. TER MOLEN: Okay. Let's go to
4 Page 1354. Okay. And, let's see. Thank you,
5 Sam.

6 Yeah, "To date" -- on the left side
7 column there just above the "Results" section,
8 Doctor, if you see that.

9 A. Yes.

10 Q. Oh, thank you.

11 "To date" -- and this is -- "This
12 emerging knowledge has not been incorporated into
13 risk assessment processes or regulatory practice.
14 Indeed, significant scientific and conceptual
15 barriers must still be overcome," et cetera.

16 And making the point, I think, Doctor --
17 and you can put this obviously in your own
18 words -- that it's still early days for looking at
19 the issue of early life exposures causing health
20 effects later in life, right?

21 A. That's right.

22 Q. Okay.

23 A. But more and more is learned as we go
24 along. There are many more examples than when

1 this conference took place. Arsenic being one.

2 Q. Okay. Well, that's interesting.

3 And arsenic, I think you indicated
4 for -- it may have been Bangladesh or a different
5 location, Doctor -- is a naturally occurring
6 element, right?

7 A. That's right.

8 Q. And it's a naturally occurring element,
9 in fact, across the world, right?

10 A. That's right. But only some parts of
11 the world does it actually enter the water -- the
12 groundwater.

13 Q. Okay.

14 A. It has to do with the geochemical
15 conditions of the layers of soil and sediment
16 below the surface.

17 Q. Okay. But it's present in the soil,
18 right?

19 A. Soil or rock.

20 Q. And with respect to the soil, is
21 potential uptake or ingestion by children the same
22 as it would be for lead?

23 A. No, it's not. It's not really -- it's
24 not on surface soils, Mark. It's in layers below

1 the surface.

2 Q. Okay. Okay. Interesting.

3 MR. TER MOLEN: Why don't we take a
4 break for -- gosh. Well, we can take a break and
5 come back, or we can call it a day and start again
6 tomorrow morning. I'd estimate I've got about
7 another, I would say, hour and a half or so,
8 probably at most, left.

9 So what would people like to do?

10 VIDEOGRAPHER: Should we go off the
11 record?

12 THE WITNESS: Go right ahead.

13 VIDEOGRAPHER: The time is 4:35 p.m.,
14 and we're off the record.

15 (Signature not waived.)

16 - - -

17 Thereupon, the deposition was adjourned
18 at 4:35 p.m.

CERTIFICATE

I, Sara S. Clark, Registered Merit Reporter, Certified Realtime Reporter, Certified Realtime Captioner, a Notary Public, duly commissioned and qualified, do hereby certify that the within-named JOSEPH GRAZIANO, PH.D. was duly remotely sworn to testify to the truth, the whole truth, and nothing but the truth.

I DO FURTHER CERTIFY that the foregoing is a verbatim transcript of the testimony as taken stenographically by me at the time, place, and on the date hereinbefore set forth, to the best of my ability.

I DO FURTHER CERTIFY that I am neither a relative nor employee nor attorney nor counsel of any of the parties to this action, and that I am neither a relative nor employee of such attorney or counsel, and that I am not financially interested in the action.

IN WITNESS WHEREOF, I have hereunto set my hand and affixed my seal on this 13th day of November, 2020.

Sara S. Clark, RPR/RMR/CRR/CRC
Notary Public
Registered Merit Reporter
Certified Realtime Reporter
Certified Realtime Captioner

My commission expires: March 10, 2023
